Table of Contents

Section 1	**General Information**	
1.1	Initial Inspection	1-1
1.2	Warranty	1-1
1.3	Product Assistance	1-1
1.4	Address of Service Centers	1-2
1.5	Maintenance Agreements	1-8
1.6	Documentation Discrepancies	1-8
1.7	Service Procedure	1-8
1.8	Return Procedure	1-8
1.9	Safety Precautions	1-9
1.10	Antistatic Precautions	1-9
Section 2	**Specifications 9310/9310M/9310L**	2-1
	Specifications	2-2
	Internal Floppy, RAM Card, Printer options	2-6
	WP01 Waveform Processing Package	2-9
	WP02 Fast Fourier Processing Package	2-12
	LeCalsoft Calibration Software	2-15
Section 3	**Block Diagram and Sub-Assemblies**	3-1
3.1	931X Block Diagram	3-2
3.2	9310 Block Diagram	3-3
3.3	9310M Block Diagram	3-4
3.4	9310L Block Diagram	3-5
3.5	9310 Sub-Assemblies	3-6
3.6	9310M Sub-Assemblies	3-6
3.7	9310L Sub-Assemblies	3-6
3.8	9310 Hardware Options	3-6
Section 4	**Theory of Operation**	
4.1	F9300-1 or F9314M-1 Processor	4-1
4.2	F9310/M/L-3 Main Card	4-3
4.3	F9300-4 GPIB and RS232	4-8
4.4	F9310-5 Front Panel	4-8
4.5	F9300-6 Centronics Interface	4-9
4.6	F9300-7 Printer Controller	4-9
4.7	93XX-Display	4-10
4.8	93XX-PS1715 Power Supply Specifications	4-12
	93XX-PS1715 Block Diagram	4-13

Section 5 Performance Verification

5.1	Turn On	5-1
5.2	Noise on the Inputs	5-1
5.2.1	Channel 1, Channel 2 1 MOhm DC	5-1
5.2.2	Channel 1, Channel 2 1 MOhm AC	5-4
5.2.3	Channel 1, Channel 2 50 Ohm DC	5-5
5.3	Channel 1, Channel 2 Offset	5-6
5.4	50 Ohm and 1 MOhm Input Impedance	5-8
5.5	Bandwidth at 50 Ohm Input Impedance	5-8
5.6	Bandwidth at 1 MOhm Input Impedance	5-11
5.7	Manual Linearity Test (NIST Traceable)	5-14
5.8	Trigger Level	5-17
5.9	Bandwidth for Ext Trigger	5-22
5.10	Smart Trigger	5-24
5.11	Time Base Accuracy	5-29
5.12	Overshoot Verification	5-32
5.13	Probe Calibrator Verification	5-34

Section 6 Internal Calibration and Diagnostics

6.1	Introduction	6-1
6.2	Diagnostic Summary	6-2
6.3	Gain and Offset Calibration Description	6-3
6.4	Trigger Level Calibration	6-3
6.5	Diagnostic Results	6-3
6.6	Gain Curves	6-4
6.7	Offset Curves	6-5
6.8	Trigger Calibration	6-7
6.9	Trigger Level	6-7
6.10	Validate Level	6-8

Section 7 Maintenance

7.1	Introduction	7-1
7.2	Disassembly and Assembly Procedure	7-1
7.2.1	Disassembly and Assembly Diagram	7-2
7.2.2	Removal of Upper Cover	7-1
7.2.3	Removal of the 93XX-PS1715 Power Supply	7-7
7.2.4	Removal of the F9300-4 GPIB/RS232 Interface	7-7
7.2.5	Removal of the Fan	7-7
7.2.6	Removal of the Fuse Holder	7-8
7.2.7	Removal of the 93XX-Video	7-8
7.2.8	Removal of the 93XX-Yoke	7-8
7.2.9	Removal of the Front Frame Assembly	7-8
7.2.10	Removal of the 93XX-Deflection	7-9
7.2.11	Removal of the 93XX-CRT	7-9
7.2.12	Removal of the F9310-5 Front Panel	7-10

7.2.13	Removal of the 9310 Keyboard	7-10
7.2.14	Removal of the F9300-1 Processor	7-11
7.2.15	Removal of the F9310-3/M/L Main Board	7-11
7.2.16	Removal of the Handle	7-12
7.2.17	Removal of the Foot Support	7-12
7.2.18	Removal of the 93XX-FD01 Floppy Disk	7-12
7.2.19	Removal of the 93XX-GP01 Graphic Printer	7-12
7.2.19	Removal of the F9300-7 Printer Controller	7-12
7.2.20	Removal of the F9300-6 Centronics Interface	7-12

SECTION 1 GENERAL INFORMATION

1.1 Initial Inspection

It is recommended that the shipment be thoroughly inspected immediately upon delivery to the purchaser. All material in the container should be checked against the enclosed Packing List. LeCroy cannot accept responsibility for shortages in comparison with the Packing List unless notified promptly. If the shipment is damaged in any way, please contact the Customer Service Department or local field office immediately.

1.2 Warranty

LeCroy warrants its oscilloscope products to operate within specifications under normal use for a period of two years from date of shipment. Spares, replacement parts and repairs are warranted for 90 days. The instrument's firmware is thoroughly tested and thought to be functional, but is supplied "as is" with no warranty of any kind covering detailed performance. Products not manufactured by LeCroy are covered solely by the warranty of the original equipment manufacturer.

In exercising this warranty, LeCroy will repair or, at its option, replace any product returned to the Customer Service Department or an authorized service facility within the warranty period, provided that the warrantor's examination discloses that the product is defective due to workmanship or materials and that the defect has not been caused by misuse, neglect, accident or abnormal conditions or operation.

LeCroy will return all in-warranty products with transportation prepaid.

This warranty is in lieu of all other warranties, expressed or implied, including but not limited to any implied warranty of merchantability, fitness, or adequacy for any particular purpose or use. LeCroy shall not be liable for any special, incidental, or consequential damages, whether in contract or otherwise.

1.3 Product Assistance

Answers to questions concerning installation, calibration, and use of LeCroy equipment are available from the Customer Service Department, 700 Chestnut Ridge road, Chestnut Ridge, New York 10977-6499, U.S.A., tel: (914) 578-6060, or 6061, and 2 rue du Pré-de-la-Fontaine, 1217 Meyrin 1, Geneva, Switzerland, tel: (41) 22 / 719.21.11, or your local field engineering office.

1.5 Maintenance Agreements

LeCroy offers a selection of customer support services. Maintenance agreements provide extended warranty and allow the customer to budget maintenance costs after the initial two year warranty has expired. Other services such as installation, training, enhancements and on-site repair are available through specific Supplemental Support Agreements.

1.6 Documentation Discrepancies

LeCroy is committed to providing state-of-the-art instrumentation and is continually refining and improving the performance of its products. While physical modifications can be implemented quite rapidly, the corrected documentation frequently requires more time to produce. Consequently, this manual may not agree in every detail with the accompanying product. There may be small discrepancies in the values of components for the purposes of pulse shape, timing, offset, etc., and, occasionally, minor logic changes, Where any such inconsistencies exist, please be assured that the unit is correct and incorporates the most up-to-date circuitry. In a similar way the firmware may undergo revision when the instrument is serviced. Should this be the case, manual updates will be made available as necessary.

1.7 Service Procedure

Products requiring maintenance should be returned to the Customer Service Department or authorized service facility. LeCroy will repair or replace any product under warranty at no charge. The purchaser is only responsible for one way transportation charges.

For all LeCroy products in need of repair after the warranty period, the customer must provide a Purchase Order Number before repairs can be initiated. The customer will be billed for parts and labor for the repair, as well as for shipping.

1.8 Return Procedure

To determine your nearest authorized service facility, contact the Customer Service Department or your field office. All products returned for repair should be identified by the model and serial numbers and include a description of the defect or failure, name and phone number of the user, and, in the case of products returned to the factory, a Return Authorization Number (RAN). The RAN may be obtained by contacting the customer service department in New York, tel: (914)578-6060, or 6061 ; in Geneva, tel: (41)22/719.21.11, or your nearest sales office.

Return shipment should be made prepaid. LeCroy will not accept C.O.D. or Collect Return Shipments. Air-freight is generally recommended. Wherever possible, the original shipping carton should be used. If a substitute carton is used, it should be rigid and be packed such that the product is surrounded with a minimum of four inches of excelsior or similar shock-absorbing material. In addressing the shipment, it is important that the Return Authorization Number be displayed on the outside of the container to ensure its prompt routing to the proper department within LeCroy.

1.9 Safety Precautions.

The following servicing instructions are for use by qualified personnel only. Do not perform any servicing other than contained in service instructions. Refer to procedures prior to performing any service.

Exercise extreme safety when testing high energy power circuits. Always turn the power OFF, disconnect the power cord, discharge the cathode ray tube and all capacitors before disassembling the instrument.

The **W A R N I N G** symbol used in this manual indicates dangers that could result in personal injury.

The **C A U T I O N** symbol used in this manual identify conditions or practices that could damage the instrument.

1.10 Antistatic Precautions

C A U T I O N

Any static charge that builds on your person or clothing may be sufficient to destroy CMOS components, integrated circuits.
In order to avoid possible damage, the usual precautions against static electricity are required.

- Handle the boards in antistatic boxes or containers with foam specially designed to prevent static build-up.
- Ground yourself with a suitable wrist strap.
- Disassembly the instrument at a properly grounded work station equipped with antistatic mat.
- When handling the boards, do not touch the pins.
- Stock the boards in antistatic bags.

SECTION 2 SPECIFICATIONS

9310/9310M/9310L

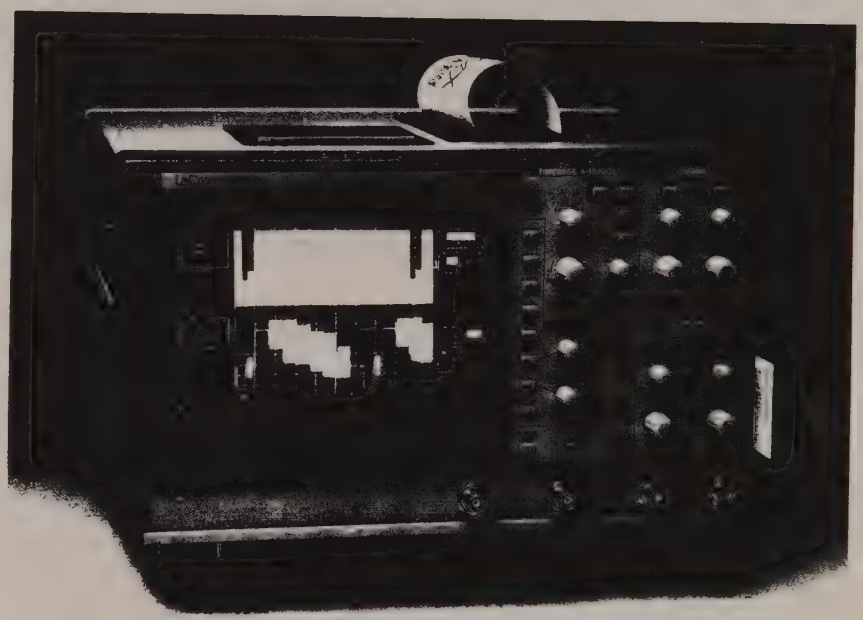
LeCroy

The Digital Scope Specialists

9310, 9310M, 9310L Digital Oscilloscopes 300 MHz Bandwidth, 100 MS/sec

Main Features

- 10K, 50K and 1M Word Records
- DOS Compatible Floppy Disk and Memory Card options
- Optional Internal Printer
- Glitch, Interval, Window, Dropout, TV and State-Qualified Triggers
- Automatic PASS/FAIL testing
- 8-bit vertical resolution; 11 with ERES option
- Fully programmable via GPIB and RS-232-C
- Persistence, XY and Roll Modes
- Advanced Signal Processing
- Two Independent Channels



The 9310 is the ideal general-purpose 2-channel 300 MHz digital oscilloscope. It captures single-shot events at up to 100 MSamples/sec, and repetitive signals at 10 GSamples/sec. Record lengths up to 1M Word provide unequalled horizontal resolution, and allow fast digitizing of long-duration events. Memories can be segmented, for minimum dead time between acquisitions.

Live waveforms may be viewed simultaneously with up to 3 expansions, showing all of the signal detail. Expansions are shown as highlights on the main trace.

SMART Trigger modes like Glitch, Window and Dropout allow you to capture precisely the events of interest. A comprehensive range of signal processing functions, on live or stored waveforms, allows waveform manipulation without destroying the underlying data.

The 9310 features the proven user-interface of LeCroy's portable scope family. A bright, high-resolution 9" CRT allows optimum waveform viewing under any conditions. Menus and text are arranged around the graticules - they never overwrite the waveforms.

Each of the main control functions is dedicated to a single knob, to keep the 9310's performance at your fingertips.

DOS compatible floppy disk and memory card options store waveforms and test setups, and make transferring data to a PC easier than ever before. Hardcopies may be made on GPIB, RS-232-C or Centronics printers or plotters. An optional internal printer is also available.

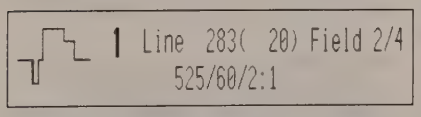
Optional packages provide extensive Waveform Processing including FFT and Enhanced Resolution to 11 bits.

Features and Benefits

PRECISION ACQUISITION
The 9310 combines all the technologies required for accurate waveform digitizing. Low-noise high-sensitivity amplifiers drive 8-bit ADC's which are clocked simultaneously by a high-precision timebase. Vertical resolution can be extended as high as 12 bits using averaging and filtering techniques. All these features are combined with a genuine 2 millivolt sensitivity setting and a big, crisp display to let you see the finest signal details.

MEMORY FOR ALL APPLICATIONS
The 9310 family is available with three different memory lengths: Standard, 10K words per channel, 50K words in the 9310M and 1M word in the 9310L. Long memories provide higher horizontal resolution, and LeCroy's unique memory management system maximizes the benefits of longer memory. Showing the entire waveform onscreen allows immediate location of glitches or other disturbances, and guarantees the highest possible sample rate at all timebase settings.

EXTENSIVE TRIGGER CAPABILITY
In normal operation, the 9310 triggers just like an analog oscilloscope. To capture rare or complex conditions, turn on the SMART trigger, and select from 11 different SMART trigger functions. These include GLITCH trigger down to 2.5ns and a unique DROPOUT mode, which causes a trigger to occur when the signal disappears for a selectable period of time. BISLOPE WINDOW and INTERVAL triggers are also available, together with TIME and EVENTS qualifiers. TV trigger allows individual lines or fields in PAL, SECAM, NTSC and non-standard video to be selected. Pre- and Post-trigger delay for all trigger modes are fully variable from the front panel.



Trigger Icons first developed for LeCroy's 9400 series show the trigger setup at a glance.

AUTOMATIC MEASUREMENTS
In addition to Cursor measurement. the 9310 performs fully Automatic Measurements. PASS/FAIL testing allows waveforms to be continually compared with a tolerance mask. (Masks may either be generated inside the instrument, or supplied on floppy disks or memory cards.) In addition, the 9310 can calculate any 5 waveform parameters from a list of 21, and compare them with user-defined limits. Any failure will cause preprogrammed actions such as Hardcopy, Save or GPIB SRQ. Basic statistics (low, high, average, standard deviation) may also be calculated on these parameters.

DOS COMPATIBLE MASS STORAGE
The 9310 offers two options (available together or separately) for built-in mass storage. Option FD01 provides a 3.5" 1.44MB floppy disk drive, which stores waveforms and setups as DOS files. This may be used as a convenient way of transferring data to a PC. Option MC01 provides high-speed storage to Industry-standard memory cards, which are also DOS compatible. Up to 8 MB of data (waveforms or setups) may be stored on a single card.

Mass Storage simplifies archiving, and can also be used to ensure that measurements are always made in the same way. Golden Waveforms (or tolerance masks) may also be stored, so that signals are compared with a known reference. Waveform processing is possible on live or stored waveforms.

BUILT-IN PRINTER
As well as driving most printers and plotters via GPIB (IEEE-488.2), RS-232-C and optional Centronics interfaces, the 9310 also offers an optional internal printer. This thermal printer produces full size screendumps in approximately 10 seconds.

FLEXIBLE INTERFACING
Both GPIB and RS-232-C interfaces may be used for full remote control of the instrument. All front-panel controls and internal processing functions can be controlled. For applications where throughput is essential, the 9310's GPIB interface can be used to transfer hundreds of waveforms per second.

POWERFUL DISPLAY MODES
The 9310's high-resolution raster display shows from one to four independent waveform grids. Persistence display mode allows easy viewing of signal changes over time, and XY mode plots any two sources against one another. Cursors are usable in all display modes.

MULTIPLE WAVEFORM ZOOM
The 9310 has four Zoom/Math traces which may be used for signal processing or zooming waveforms. Up to four traces (e.g. a waveform and three different expansions) may be viewed simultaneously. Alternatively, four different expansions of the same waveform may be viewed. Zoom factors of up to 20,000x (1 M memories) allow signal details to be examined.

The area to be expanded is selected by moving an intensified portion of the waveform. Cursor measurements may be made from one expanded portion to another, providing the most accurate time measurements possible.

EXTENSIVE WAVEFORM MATH
The 9310's built-in processing includes mathematics (Add, Subtract, Multiply and Divide, Negation and Identity) and Summation Averaging (up to 1000 sweeps). Option WP01 provides Averaging (Summed and Continuous) and Mathematics (including ABS, Differentiation, Identity, Integration, Log or Exp (base e or base 10), Negation, Reciprocal, Rescale, Sin(x)/x, Square and Square root). Also included is Enhanced Resolution mode (up to 11 bits) and Extrema mode for storage of peak positive and negative values. More information is available in the 9300 WP01 datasheet.

OPTIONAL FFT PACKAGE
Option WP02 provides comprehensive Spectral Analysis capabilities. These permit the system designer to identify characteristics which may not be apparent in the time domain. WP02 provides a wide selection of displayed projections (magnitude, phase, real, imaginary, power spectrum, power density) and windowing functions, as well as averaging in the frequency domain. For more information, see the 9300 WP02 datasheet.

9310, 9310M, 9310L Specifications

ACQUISITION SYSTEM
Bandwidth (-3 dB):
@ 50Ω: DC to 300 MHz
@ 1 MΩ DC: DC to 250 MHz
typical at the probe tip.
No. of Channels: 2
No. of Digitizers: 2
Maximum Sample Rate: 100 MS/sec simultaneously on each channel.
Aperture uncertainty: ± 10 psec.
Sensitivity: 2 mV/div to 5 V/div, fully variable.
Scale factors: Probe attenuation factors of X1, X10, X100, X1,000 and X10,000 selectable.
Offset Range: 2.0 - 9.9 mV/div: ± 120 mV
10.0 - 199 mV/div: ± 1.2 V
0.2 - 5.0 V/div: ± 24 V
DC Accuracy: ≤ ± 2% full scale (8 divisions)
Vertical Resolution: 8 bits.
Bandwidth Limiter: 30 MHz.
Input Coupling: AC, DC, GND.
Input Impedance: 1 MΩ||15 pF or 50Ω ± 1%
Max Input: 1 MΩ:250V (DC+peak AC≤ 10KHz)
50Ω:± 5V DC (500 mW) or 5V RMS

TIME BASE SYSTEM
Timebases: Main and up to 4 Zoom Traces. Any 4 traces may be viewed simultaneously.
Time/Div Range: 1 ns/div to 1000 s/div.
Clock Accuracy: ≤ ± 0.002%.
External Clock: DC - 100 MHz (Ext Trig BNC)
Interpolator resolution: 10 psec.
Interpolator accuracy: 15 psec RMS.
Roll Mode: ranges 500 ms to 1,000 s/div. (9310L with 1M memory: 10 s to 1,000 s/div)
Acquisition memories: (per channel)

9310	9310M	9310L
10K	50K	1M

ACQUISITION MODES
Random Interleaved Sampling (RIS): for repetitive signals from 1 ns/div to 5 µs/div.
Single shot: for transient and repetitive signals from 50 ns/div to 200 ms/div. (9310L with 1M memory: 50 ns/div to 5 s/div).
Sequence: Stores multiple events in segmented acquisition memories.
Number of segments available:

9310	9310M	9310L
2-50	2-200	2-2,000

Dead Time between segments: ≤150 µs

TRIGGERING SYSTEM
Trigger Modes:
Stop: Holds the last event acquired.
Normal: Re-arms after each sweep. If no trigger occurs after a reasonable length of time, the message "Slow Trigger" is displayed.
Auto: Automatically re-arms after each sweep. If no trigger occurs, one is generated at an appropriate rate.
Single (hold): Holds the next event to be acquired. Re-arms only when the "single" button is pressed again.

Trigger Sources: CH1, CH2, Line, Ext, Ext/10 (Slope, Level and Coupling for each can be set independently.)
Slope: Positive, Negative, Window (BiSlope).
Coupling: AC, DC, HF, LFREJ, HFREJ.
Pre-trigger recording: 0 to 100% of full scale (adjustable in 0.1 div increments).
Post-trigger delay: 0 to 10,000 divisions (adjustable in 0.1 div increments).
Holdoff by time: 25 ns to 20s.
Holdoff by events: 0 to 99,999,999 events.
Trigger Bandwidth: Up to 500 MHz using HF coupling.
Internal Trigger Sensitivity Range: ± 5 div.
Ext Trigger Input: 1 MΩ||15pF, 250V Max. (DC+peak AC≤ 10KHz).
Ext Trigger Range: ±2V (±20V with Ext/10).
Trigger Timing: Trigger Date and Time are listed in the Memory Status Menu.

SMART TRIGGER TYPES
Pulse Width: Trigger on pulse width between two limits selectable from 2.5ns to 20s.
Interval Width: Trigger on pulse spacing between two limits from 2.5ns to 20s.
Dropout: Trigger if the input signal drops out for longer than a timeout from 25ns to 20s.
State/Edge Qualified: Trigger on any source only if a given state (or transition) has occurred on one of the other possible sources. The delay between these events can be defined as a number of events on the trigger channel or as a time interval.
TV: Allows selection of both line (up to 1500) and field number (up to 8) for PAL, SECAM, NTSC or non-standard video.

DISPLAY
Waveform style: Vectors connect the individual sample points, which are highlighted as dots.
CRT: 12.5x17.5 cm (9" diagonal) raster.
Resolution: 810 x 696 points.
Modes: Normal, X-Y, Infinite Persistence.
Real-time Clock: Date, hours, minutes, sec.
Graticules: Internally generated; separate intensity control for grids and waveforms.
Grids: 1, 2 or 4 grids.
Formats: YT, XY, and both together.
Vertical Zoom: Up to 5x Vertical Expansion (50x with averaging, up to 40 µV sensitivity).
Horizontal Zoom Factors:

9310	9310M	9310L
up to 200x	1,000x	20,000x

INTERNAL MEMORY
Waveform Memory: Four 16-bit Memories (M1,M2,M3,M4) for full 10K or 50K records.
Processing Memory: Four 16-bit Waveform Processing Memories (A,B,C,D) of 10K or 50K.
Setup Memory: Four non-volatile memories.

MEASUREMENT SYSTEM
Automatic Measurements determine:

Amplitude	Frequency	Period
Area	Maximum	Peak to Peak
Base	Mean	Risetime
Cycles	Median	RMS
Delay	Minimum	Std Dev
Duty Cycle	Overshoot +	Top
Falltime	Overshoot -	Width

(As defined by ANSI/IEEE Std 181-1977).

Two cross-hair cursors are used to define the region over which these parameters are calculated. The following statistical calculations are also available for each measurement: Average, High, Low, Standard Deviation.

Pass/Fail testing allows up to five of the above listed parameters to be tested against selectable thresholds. Waveform Limit Testing is performed using templates which may be defined inside the instrument.

CURSOR MEASUREMENTS
Relative Time: Two cursors provide time measurements with resolution of ±0.05% full-scale. The corresponding frequency value is also displayed.
Relative Voltage: Two horizontal bars measure voltage differences up to ±0.2% of full-scale in single-grid mode.
Absolute Time: A cross-hair marker measures time relative to the trigger and voltage with respect to ground.
Absolute Voltage: A reference bar measures voltage with respect to ground.

WAVEFORM PROCESSING
Up to four processing functions may be performed simultaneously. Functions available are: Add, Subtract, Multiply, Divide, Negate, Identity and Summation Averaging.

Average: Summed Averaging of up to 1,000 waveforms in the basic instrument. Up to 10^6 averages are possible with Option WP01.
Envelope*: Max, Min, or Max and Min values of from 1 to 10^6 waveforms.
ERES*: Low-Pass digital filter provides up to 11 bits vertical resolution.
Sampled data is always available, even when trace is turned off. Any of the above modes can be invoked without destroying the data.

*Envelope and ERES modes are provided in Math Package WP01.

AUTOSETUP
Pressing Autosetup sets timebase, trigger and sensitivity to display a wide range of repetitive signals. (Amplitude 2mV to 40V; frequency above 50Hz; Duty cycle greater than 0.1%).
Autosetup Time: Approximately 2 seconds.
Vertical Find: Automatically sets sensitivity and offset.

SELF TESTS
Auto-calibration ensures specified DC and timing accuracy.

INTERFACING
Remote Control: of all front-panel controls, as well as all internal functions is possible by GPIB and RS-232-C.
RS-232-C Port: Asynchronous up to 19200 baud for computer/terminal control or printer/plotter connection.
GPIB Port: (IEEE-488.1) Configurable as talker/listener for computer control and fast data transfer. Command Language complies with requirements of IEEE-488.2
Centronics: Optional parallel interface.
Hardcopy: Screen dumps are activated by a front-panel button or via remote control. TIFF format is available for importing to DTP programs. The following printers and plotters can be used to make hardcopies: HP ThinkJet, QuietJet, LaserJet, PaintJet (color), DeskJet (color) and EPSON printers. HP 7400 and 7500 series, or HPGL compatible plotters. An optional internal printer is also available.

PROBES
Model: Two 9020 (X10, 10 MΩ // 15 pF) probes supplied.
Probe calibrator: BNC connector provides rectangular pulses, 250 mV into 50Ω, 50% duty cycle; rise/fall times < 500 psec; flatness <1%; zero offset, programmable frequency. May also provide, under menu control, a Trigger Output or Pass/Fail Output.

GENERAL
Temperature: 5° to 40° C (41° to 104° F) rated 0° to 50° C (32° to 122° F) operating.
Humidity: < 80%.
Shock & Vibration: Meets MIL-STD-810C modified to LeCroy design specifications and MIL-T-28800C.
Power: 90-250 V AC, 45-66 Hz, 150 W.
Battery Backup: Front-panel settings maintained for two years.
Dimensions: (HWD) 8.5"x14.5"x16.25", 210mm x 370mm x 410mm.
Weight: 10kg (22lbs) net, 15.5kg (34lbs) shipping.
Warranty: Two years.

Ordering Information

Oscilloscope and Options

9310/M/L	Digital Oscilloscope
9310-WP01	Waveform Math
9310-WP02	FFT Processing
9310-MC01	Memory Card Reader
9310-FD01	3.5" Floppy Disk Drive + Centronics Interface
9310-GP01	Internal Printer + Centronics Interface
93XX-GP-R	Roll paper for Printer (10 rolls)

Oscilloscope Accessories
Supplied with Instrument:

9310-OM	Operator's Manual
9310-SM	Service Manual
9310-FC	Front Cover

Ordered separately:

9310-MC02	128K Memory Card
9310-MC04	512K Memory Card
DC/GPIB-2	2 Meter GPIB Cable
SG9001	High Voltage Protector
OC9001	Oscilloscope Cart

LeCroy
The Digital Scope Specialists

9300 series internal 3.5" Floppy, RAM card, Printer

Main Features

- 3.5" Floppy drive, DOS format, affordable and convenient
- Ultra-fast RAM card, DOS format, ideal for PASS/FAIL testing
- High-resolution Printer, ideal for fast, on-the-spot documentation
- Convenient Hardcopy storage to card/disk

3.5" Floppy

The floppy drive is a convenient storage medium, not only for saving and retrieving waveforms or instrument settings, but also for storing hardcopies that can be printed from a PC when desired. The floppy supports both 720K and 1.44M DOS formats so that it can be read back on any PC with a 3.5" drive, avoiding the need to interface the oscilloscope to your PC. As with the RAM-card option, the floppy system capabilities include automatic storage of data under pre-programmed conditions.

RAM Card

The RAM card is a fast and compact storage medium for saving and retrieving waveforms or instrument settings. It complies fully with the PC industry's PCMCIA/JEIDA standard. With the special Autostore feature, waveforms can be automatically stored to the card after every acquisition, and "played back" when desired. And with the scope's powerful PASS/FAIL feature, failure data can also be saved automatically to the RAM card.

Printer

The internal printer is an invaluable tool for instant, on-the-spot documentation. It generates a clear, crisp hardcopy of the screen in just a few seconds. The printout's large size combined with its high-resolution provide you with an excellent document that matches the screen's superior quality even to the finest details. And because it frees you from the trouble of carrying and interfacing a bulky printer, it's the ideal solution for field measurements.

Mass-storage Features and Benefits

LeCroy's mass storage capabilities provide a range of benefits:
- Easy data transfers to PCs
- Waveform logging
- Waveform archiving for future use
- Faster troubleshooting
- Faster, more reproducible testing
- Shared oscilloscope resources

EASY DATA TRANSFERS TO PCs
Because the 9300 series oscilloscope uses DOS-formatted floppy disks and memory cards, transferring waveform data to a PC is a breeze. The removable storage allows transfers without cables, programming, or any knowledge of GPIB, RS-232, or other interfaces. And what's more, LeCroy provides, free of charge, a binary-to-ASCII format conversion program for the PC since some PC-based analysis packages (such as spreadsheets), require ASCII format.

WAVEFORM LOGGING
By using Glitch or Dropout triggering in combination with the powerful AUTOSTORE mode, LeCroy oscilloscopes can monitor and log intermittent problems automatically. To store a waveform, the oscilloscope opens and names a DOS-compatible file and then stores the waveform data into the file. This logging feature requires no operator intervention and maintains data and the operational setup through power line failures. Logged waveforms can be selectively played back by trigger time/date or by sequence number, or can be scrolled through sequentially.

WAVEFORM ARCHIVING FOR FUTURE USE
- Recallable proof of performance
- Additional data analysis as needed
- Accurate trend or drift monitoring
- Calibration procedure verification

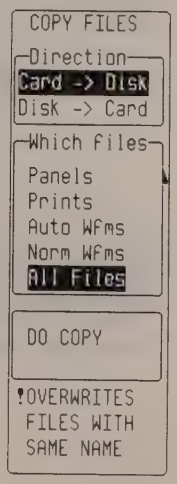
When storing waveforms, LeCroy DSOs also archive a header of setup information and the acquisition time/date. After recalling an archived waveform, the several hundred byte header ensures correct time and voltage scaling. When recalled into the oscilloscope, the waveform can be zoom expanded, compared, or analyzed just like a live waveform. The time/date offers proof of measurement authenticity and trend sequence.
All LeCroy DSOs store raw waveform data using one byte per sample point. Signal averaged, Enhanced Resolution (ERES) filtered, and other processed data use two bytes per point, to take advantage of the added resolution.

HARDCOPY ARCHIVING
Hardcopies of the screen can also be stored for future use. For instance, a screen saved in TIFF format can eventually be imported into a Word Processor to illustrate a report. As another example, field-measurement screens could be saved in LaserJet format on the memory card or floppy disk, and then printed from a PC back in the lab.

FASTER FIELD MEASUREMENTS
Recallable reference waveforms and oscilloscope setups for each test point on a Device Under Test (DUT) can make fault troubleshooting faster and more accurate. A dedicated memory card or floppy disk can hold all of the correct test point waveforms and associated DSO setups for a particular DUT.
The technician can recall stored setups quickly and consistently, thereby avoiding incorrect measurement conditions. He can then compare actual waveforms to recalled reference waveforms taken from a known working system. So the technician needs less knowledge and skill to quickly probe a large number of test points and verify that the correct waveforms exist.
If a problem is found, the aberrant waveform may be saved. It can later be shown to laboratory-based engineers, for example, for problem-solving guidance or for improvement of DUT design.
Memory cards, being rugged and shirt-pocket sized, are ideal for this application.

FASTER, MORE REPRODUCIBLE TESTING
LeCroy oscilloscopes can compare measured waveforms against upper and lower waveshape tolerances or against parameter limits, such as risetime, overshoot, or peak voltage, and make PASS/FAIL decisions. This PASS/FAIL testing decreases test times in GPIB-based ATE systems by reducing data transfers. It increases reproducibility and accuracy in manual tests by eliminating human errors.
Once defined, these tests may be saved by storing instrument setups which include the specified tolerances and/or reference waveforms. Different test personnel can easily share a common test library via PC network.
Waveshape test limits can be generated by capturing a "golden" waveform and by then selecting amplitude and timing limits (in fractions of screen graticule divisions). Or a user can create standard waveform limit templates on a computer (e.g. ANSI/CCITT telecommunication templates)
On LeCroy 9300 series DSOs, specific parameter tolerance test procedures are created by selecting limits for any five out of twenty pulse parameters with Boolean AND or OR conditions between them. During testing , FAIL responses can include an audible beep, GPIB SRQ, hardcopy output, or store to memory card.

SHARED OSCILLOSCOPE RESOURCES
Tired of spending hours to recover your precious setup after someone else used your instrument? Just plug-in your *personal* RAM card or floppy and restore your setup in just seconds. Each individual user can keep his own preferred setups on his own floppy disk or RAM card.



A selection of files can be copied from the memory card to the disk and vice-versa.

Hardcopy Features and Benefits

The internal printer adds a whole range of benefits to the LeCroy 9300 series:
- Ultra fast printouts
- High resolution printing
- No-trouble interfacing
- No-trouble carrying

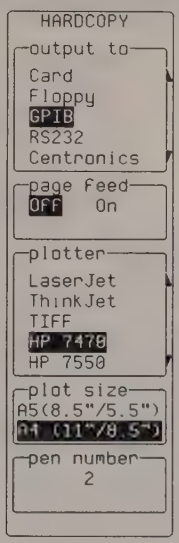
ULTRA-FAST PRINTOUTS
Measurement documentation is made easier - and faster - than ever since the internal printer produces a hardcopy in less than 10 seconds. What's more the document is date- and time-stamped: a real bonus for archiving those test results.

HIGH RESOLUTION PRINTING
With a resolution of 190 dots-per-inch, the internal printer matches the screen's superior quality, to document the captured traces down to their finest details. And the size of the printout is impressive for an internal printer: a full 7" diagonal!

TROUBLE-FREE INTERFACING
Tired of struggling with cable schematics, baud rates, gender-changers, and dip switches? The internal printer frees your mind for more productive tasks. Just select the internal printer in the scope's utilities menu, hit the SCREEN DUMP button, and you're in business!

TROUBLE-FREE TRANSPORTING
Having a printer totally integrated in the instrument makes life much easier for field-measurement applications. Imagine carrying a scope, a printer (and perhaps a floppy drive) in one hand!

The 9300 series oscilloscope supports a whole range of popular printers and plotters. Hardcopies of the screen can be either sent directly to the device or to the card/ floppy for future use.



OTHER HARDCOPY SOLUTIONS
High quality project reports, presentation materials, technical manuals, and troubleshooting instructions often require integration of text and graphics on the same page. Advanced PC desktop publishing - and more and more word processors - Such as Word-for-Windows, WordPerfect, or AMI Pro can directly import graphic files, size them, and position them anywhere on the page. Written text can then wrap around or be positioned within the graphics. LeCroy 9300 oscilloscopes can save screens in TIFF (Tagged Image Format File). After transferring the file to a PC, the DTP software can import and manipulate the document like any other graphic object.
The LeCroy 9300 series also offers a wide range of interfacing capabilities with external hardcopy devices:
- Plotters. HPGL, HP 7400 and 7500 compatible
- Printers. HP LaserJet, ThinkJet, Paintjet (including color), DeskJet (including color) and Epson
- Interfacing. RS-232, GPIB, or even Centronics (optional)

Floppy drive, RAM card and Printer Specifications

3.5" FLOPPY DRIVE
Type: 3.5 inch floppy drive, DOS format.
Supported disk formats: 720KB, 1.44MB
Maximum transfer rate: 15 kB/sec
Typical Waveform Transfer Speed:

Length	Store	Recall
1000	2.2 s	0.4 s
10000	2.7 s	1.0 s
50000	5.5 s	3.4 s

Waveform File Size: A channel-trace will use 1 byte per sample plus approximatively 359 bytes of waveform descriptor. A processed trace will use 2 bytes per sample.
Template Size: Approximatively 21K bytes.
Panel Setup Size: Approximatively 3K bytes.

RAM CARD
Type: PCMCIA 1.0 JEIDA 3.0 & 4.0.
Supported card formats: SRAM for reading and writing, ROM, OTP, and FLASH for reading, the driver software supports card sizes up to 8MB.
Maximum transfer rate: 170 kB/sec
Typical Waveform Transfer Speed:

Length	Store	Recall
1000	25 ms	20 ms
10000	100 ms	80 ms
50000	400 ms	300 ms

Waveform File Size: Same as for the floppy.
Template Size: Approximately 21K bytes.
Panel Setup Size: Approximately 3K bytes.

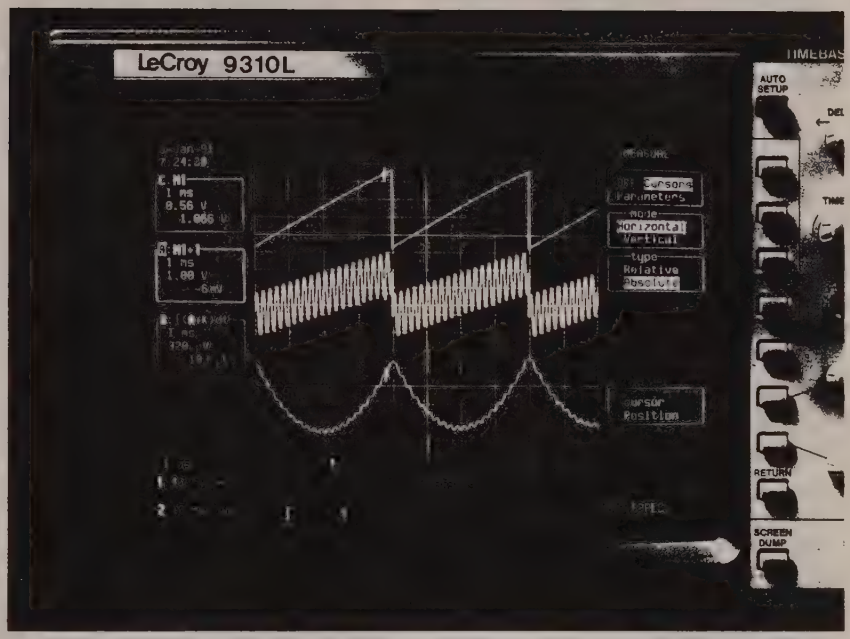
PRINTER
Type: Raster printer, thermal.
Resolution: 190 DPI.
Printout Size: 126 mm x 90 mm
Paper: Thermal printer paper, 30 meter roll, 110 mm width, type Seiko or similar.
Printing speed: 6 seconds approx. for one screen.

9300 WP01

WP01 Waveform Processing Firmware for the 9300 Family of Digital Oscilloscopes

Main Features

- Averaging - summation and continuous
- Arithmetic - including addition, subtraction, ratio and multiplication
- Functions - including integration, differentiation, log, expansion, ABS, square root and more
- Extrema mode - storage of extreme positive and negative values



Added as a factory option or retrofitted in the field, the WP01 Waveform Processing Package adds high-speed averaging, filtering and mathematical capabilities to the 9300 family of digital oscilloscopes.

General

The LeCroy WP01 Waveform Processing package offers powerful routines that extend the processing capabilities of the 9300 family of Digital Oscilloscopes.

All processing is built in to eliminate the need for external computers and controllers. High-speed microprocessors are used to ensure that computed waveforms are displayed instantly on the screen.

The package is fully programmable over GPIB or RS-232-C interface and hard copies can be directly made onto a wide range of printers.

Features and Benefits

EXTENSIVE SIGNAL AVERAGING
Two operation modes:
Summation averaging up to 1,000,000 waveforms.
Continuous averaging with weighting factors up to 1023.
Average speed up to 200,000 points/s in summation averaging mode.

EXTREMA MODE
Keeps track of time and amplitude drift by storing extreme positive and negative values, such as glitches, over a programmable number of sweeps.

POWERFUL ARITHMETIC
Processes addition, subtraction, multiplication or division on any pair of waveforms.

MATHEMATICAL FUNCTIONS
Computes identity, negation, reciprocal, integration, differentiation, square, square root, absolute value, sin x/x, exponential and log on any waveform.

ENHANCED RESOLUTION
Allows filtering of the digitized signals, whether they are single-shot or repetitive, in order to increase the resolution of the displayed trace from 8 bits to 11 bits in steps of 0.5 bits.

VERTICAL EXPANSION
Provides vertical scale expansion by a factor of up to 50.

CHAINING OF OPERATIONS
Automatically chains up to four operations. An indefinite number of operations can be performed sequentially, either manually or via remote control.

REMOTE CONTROL
Controls remotely all front-panel settings, as well as all waveform processing options via either GPIB or RS-232-C interfaces.

Functional Description

The WP01 waveform processing package can be implemented in any of the models of the 9300 family of digital oscilloscopes. This firmware is optimized for processing signals in real time. A powerful 68020 microprocessor and a 68881 co-processor enable very rapid representation of results such as averages, integrations, exponentials and multiplications.

Waveform operations can be performed on live, stored, processed or expanded waveforms. They are selected through simple menus that allow functions to be chained together allowing more complex computations. For example, it is possible to perform the integration of an averaged waveform or the multiplication of a differentiated waveform.

All processing occurs in function memories A, B, C and D which may be displayed on the screen by simply pressing the appropriate function button. All the necessary processing is automatically performed for all the functions selected.

The number of points used in the calculations is selectable and goes from 50 to 10,000 points for models with 10,000 data points of memory per channel. It goes up to 50,000 points for all other models.

SIGNAL AVERAGING
WP01 offers two powerful, high-speed averaging modes that can be used to reduce noise and improve the signal-to-noise ratio. Vertical resolution can be extended by several bits to improve dynamic range and increase the overall input sensitivity to as much as 50 mV/division.

Summed Averaging consists of the repeated addition (with equal weight) of recurrences of the selected source waveform. The number of acquisitions averaged can be selected up to 1,000,000 sweeps with the accumulation automatically stopping when the number is reached.

Continuous Averaging, sometimes called exponential averaging, is the repeated weighted average of the source waveform with the previous average. Averaging goes on indefinitely with each new acquisition and the effect of previous waveforms gradually tends to zero. Relative weighting factors can be chosen from 1:1 to 1:1023. The method is particularly useful for monitoring noisy signals which may change slowly over a period of time.

ENHANCED RESOLUTION
The WP01 package provides a selective filtering technique that improves vertical resolution for reduced bandwidth applications. By effectively removing high-frequency noise, with digital smoothing functions, waveforms can be analyzed with resolution from 8 to 11 bits. The technique can be used with both single-shot and repetitive signals and provides an ideal method for smoothing transient phenomena.

EXTREMA MODE
Tracking rare glitches or monitoring signals drifting in time and amplitude is made easy with EXTREMA mode. EXTREMA waveforms are produced by repeatedly comparing acquisitions of a source waveform with a stored waveform that contains previous maximum and/or minimum excursions. Whenever a given data point of a new acquisition exceeds the existing data point of the stored waveform, the old data point is replaced by the new. In this way the envelope of all waveforms is accumulated for up to a maximum of 1,000,000 sweeps.

ARITHMETIC
The 9300 family offers basic arithmetic operations such as addition, subtraction, division, multiplication and negation, even on the standard models. These arithmetic functions can be performed on any source waveform on a point-by-point basis. Different vertical gains and offsets of the source waveforms are automatically taken into account in the computed result.

MATHEMATICAL FUNCTIONS
Functions including differentiation, integration, absolute value, square, square root, logarithm (base 10 and e), exponential, reciprocal, and sin x/x interpolation may be performed on any source waveform. Arithmetical and mathematical functions can also be chained together to construct more complex processing routines.

SUMMATION AVERAGING
Number of Sweeps: 1 to 1,000,000.
Number of Input Points: 50 to 50,000 (50 to 10,000 for models with 10,000 data points per channel).
Vertical Expansion: 50 x maximum.
Maximum Sensitivity: 50 mV/div after vertical expansion.
Speed: up to 200,000 points/s.

CONTINUOUS AVERAGING
Possible Weighting Factors: 1:1, 1:3, 1:7, 1:15, 1:31, 1:63, 1:127, 1:255, 1:511 and 1:1023.
Number of Input Points: 50 to 50,000 (50 to 10,000 for models with 10,000 data points per channel).
Vertical Expansion: 50 x maximum.
Maximum Sensitivity: 50 mV/div after vertical expansion.

ARITHMETIC
Addition, subtraction, multiplication, and ratio on any two waveforms.
Number of Input Points: 50 to 50,000 (50 to 10,000 for models with 10,000 data points per channel).
Vertical Expansion: 5 x to 50 x depending on the source waveforms.

FUNCTIONS
Identity, negation, integration, differentiation, square, square root, logarithm and exponential (base e and 10), sin x/x, reciprocal and absolute value of any source waveforms.

Number of Input points: 50 to 50,000 (50 to 10,000 for models with 10,000 data points per channel).
Vertical Expansion: 5 x to 50 x depending on the source waveforms.

ENHANCED RESOLUTION
Choice of five low-pass filters for vertical resolution improvement from 8 to 11 bits at reduced bandwidth.

Vertical Expansion: 50 x maximum.
Maximum Sensitivity: 50 mV/div after vertical expansion.

EXTREMA
Logs all extreme values of a waveform over a programmable number of sweeps. Maxima and minima can be displayed together, or separately by choosing ROOF or FLOOR traces.

Number of Sweeps: 1 to 1,000,000.
Number of Input Points: 50 to 50,000 (50 to 10,000 for models with 10,000 data points per channel).

Glitches as short as 0.002% of the time base down to 10 ns are displayed.
Vertical Expansion: 5 x maximum.

CHAINING OF OPERATIONS
Up to four functions can be automatically chained using Functions A, B, C and D. Using memories M1 to M4 for intermediate results, any number of operations can be chained manually or via remote control.

REMOTE CONTROL
All controls and waveform processing functions are fully programmable using the oscilloscope's GPIB or RS-232-C interfaces. Simple English-like commands are used.

STORED FRONT PANELS
Up to four front-panel setups, including WP01 settings, can be stored in resident non-volatile memory and recalled using the menu buttons or via remote control.

9300 WP02

WP02 Spectrum Analysis Firmware for the 9300 Family of Digital Oscilloscopes

Main Features

- Up to 50,000-point FFTs over two or four channels simultaneously
- Frequency range from DC to up to 300 MHz
- Frequency resolution down to 20 μHz
- Up to 10 Gs/s sampling rates
- Frequency domain averaging
- Wide selection of display formats and window functions
- 1,000-point FFTs in less than 0.5 s

Adding the WP02 Spectrum Analysis Package to the 9300 family of digital oscilloscopes provides a fast and economical solution to frequency domain applications.

General

The WP02 Spectrum Analysis Package extends the range of measurement capabilities of the 9300 series of Digital Oscilloscopes. The package is fully programmable over GPIB and RS-232-C interfaces.

Fast Fourier Transforms (FFTs) rapidly convert time domain waveforms into frequency domain records to reveal valuable spectral information such as phase, magnitude and power.

Hardcopies can be directly made on a wide range of printers. As the package is a firmware option which is installed inside the oscilloscope, it eliminates the need for any external controller and is easy to retrofit.

Features and Benefits

LONG RECORD TRANSFORMS
Long record FFTs (up to 10,000 points or up to 50,000 points, depending on the model) provide significant signal-to-noise ratio improvement.

WIDE-BAND FREQUENCY ANALYSIS
DC to up to 300 MHz bandwidth with high resolution.

HIGH SAMPLING RATES
Up to 10 gigasamples/s effectively eliminates aliasing errors.

BROAD SPECTRUM COVERAGE
Up to 25,000 spectral components (5,000 for 10,000-point memory).

MULTI-CHANNEL ANALYSIS
All input channels can be analyzed simultaneously to allow comparison of independent signals for common frequency-domain characteristics.

VERSATILE DISPLAY FORMATS
Frequency-domain data may be presented as magnitude, phase, real, imaginary, complex, log-power and log-PSD (Power Spectral Density). These display formats can all be selected via menu options.

STANDARD WINDOW FUNCTIONS
Rectangular for transient signals; von Hann (Hanning) and Hamming for continuous waveform data; Flattop for accurate amplitude measurements; Blackman-Harris for maximum frequency resolution.

CALIBRATED VERTICAL SCALING
Flattop truncation window provides precisely calibrated vertical scaling for all spectral components.

FREQUENCY DOMAIN AVERAGING
Up to 50,00 FFT results may be averaged to reduce base-line noise and enable analysis of phase-incoherent signals or signals which cannot be triggered on.

TIME-DOMAIN AVERAGING
Averaging real-time signals prior to FFT execution can increase the dynamic range up to 70 dB.

FREQUENCY CURSORS
Cursors give up to 0.004% frequency resolution (up to 0.002% for 10,000 point memory) and measure power or voltage differences to 0.2% of full scale.

CHAINING OF OPERATIONS
Up to four operations can be automatically chained, e.g., Function D=FFT of (CH1 X CH2). Any number of operations can be performed sequentially, either manually or via remote control.

FULL REMOTE CONTROL
All front-panel settings and waveform processing functions are programmable via GPIB or RS-232-C interfaces. Acquired and processed waveforms can be down-loaded to a computer and can later be retrieved and displayed on the oscilloscope.

HARD COPIES
Provides hard copies of the screen using a wide range of printers.

PROCESSING OF EXPANSIONS
Up to four regions of the same waveform, or of different waveforms, can be expanded and processed simultaneously.

FFT ON SEGMENTED WAVEFORMS
Individual waveform segments can be expanded and then analyzed using FFT. Time and date information is automatically recorded for each segment.

FOURIER PROCESSING
Fourier processing is a mathematical technique which enables a time-domain waveform to be described in terms of frequency-domain magnitude and phase, or real and imaginary spectra. It is used, for example, in spectral analysis where a waveform is sampled and digitized, then transformed by a Discrete Fourier Transform (DFT). Fast Fourier Transforms (FFT) are a set of algorithms used to reduce the computation time (by better than a factor of 100 for a 1000 point FFT) needed to evaluate a DFT. The principal advantage of FFT is the speed with which it can analyze large quantities of waveform samples. Using standard measurement techniques, FFT converts a time-domain measurement instrument into a digital spectrum analyzer.

The Spectrum Analysis package enhances the outstanding features of the LeCroy 9300 family. It provides high resolution and wide-band spectrum analysis together with sophisticated window functions and fast processing.

FFT AND LeCROY OSCILLOSCOPES
In FFT mode, LeCroy oscilloscopes provide measurement capabilities superior to those of common swept spectrum analyzers. It is now possible to perform spectral analysis on repetitive and single events at an attractive price. Users can obtain time and frequency values simultaneously and compare phases of the various frequency components with each other.
Rather than the commonly used "power of two" record lengths, the routines used in the WP02 package feature decimal record lengths which can be selected in a 1, 2.5, 5 sequence. Resulting spectra are also calibrated in convenient decimal Hertz values.
The WP02 package is supported by the exceptional acquisition characteristics which are the hallmark of LeCroy oscilloscopes (+2% DC accuracy, high effective bits, improved resolution through averaging). Computations are made using 16-bit processing that allows high accuracy, stability and repeatability.
With LeCroy oscilloscopes, signals may be acquired from up to four acquisition channels and processed simultaneously using up to four functions. This is particularly useful for network characterization or when looking for common frequency-domain characteristics on multiple signals.

IMPROVED RESOLUTION
Fast Fourier Transform calculates equally-spaced frequency components from DC to the full instrument bandwidth. By lowering the sampling rate, it is possible to make measurements with 20 μHz resolution up to 0.5 Hz (Nyquist). By increasing the sampling mode, the widest resolution becomes 100 MHz and the Nyquist frequency 5.0 GHz. This is comfortably above the highest frequency components recordable by the oscilloscope, thus virtually eliminates aliasing effects.

WP02 Specifications

MEMORIES

	9304/10/14	9310M/L and 9314M/L
Acquisition memory/ch (8-bit)	10K points	50K points
Reference memories (16-bit)	4 x 10K points	4 x 50K points
Function memories (16-bit)	4 x 10K points	4 x 50K points

FREQUENCY

		9304/10/14	9310M/L and 9314M/L
Frequency resolution		0.1 mHz to 50 MHz	20 μHz to 100 MHz
Horizontal expansion		100 X	1000 X
Transform size	in	40 to 10000 points	40 to 50000 points
	out	20 to 5000 points	20 to 25000 points

Frequency Range: DC to instrument bandwidth.
Nyquist Frequency Range: 0.5 Hz to 5 GHz.
Frequency Scale Factors: 0.05 Hz/div to 0.2 GHz/div in a 1-2-5 sequence.
Frequency Accuracy: 0.01%.
Selection of the Transform Size: The number of points can be selected in a 1, 2.5, 5 sequence. The transform size defines the decimation applied to the signal after acquisition. It can be adjusted and optimized after signal acquisition and prior to FFT execution.

AMPLITUDE AND PHASE

Amplitude Accuracy: Better than 2%. Amplitude accuracy may be modified by the window function (see the window functions table).
Signal Overflow: A warning is provided at the top of the display when the input signal exceeds the ADC range.
Number of Traces: Time domain and frequency domain data can be displayed simultaneously (up to 4 waveforms).
Phase Range: -180° to +180° .
Phase Accuracy: ±5 (for amplitude > 1.4 div).
Phase Scale Factor: 50° /division.
Zero Baseline: 0 div (center of screen).

SPECTRUM DISPLAY FORMATS AND SCALING

Frequency Scale: Linear, real, imaginary or complex spectrum, in V/div, zero base line at 0 div (center of screen).
Power Spectrum in dBm (1 mW into 50 Ω).
Power Spectral Density (PSD) in dBm.
Phase Display: Linear.
Magnitude Display: Linear. Power and PSD spectra displays have 160 dB range (20 dB/div), continuously expandable up to 0.5 dBm/div.

FREQUENCY DOMAIN POWER AVERAGING

Summation averaging of power, PSD or magnitude for up to 50,000 spectra.

VERTICAL EXPANSION

All spectral formats, up to 50 times, continuously.

DEFINITIONS

Filter Bandwidth at -6 dB characterizes the frequency resolution of the filter.
Highest Side Lobe indicates the reduction in leakage of signal components into neighboring frequency bins.
Scallop Loss is the maximum loss of an equivalent rectangular filter.

WINDOW FUNCTIONS

Rectangular, von Hann (Hanning), Hamming, Flattop and Blackman-Harris. The table below indicates the filter pass-band shape and the resolution.

CURSORS

Absolute (crosshair) and relative (arrow) cursors provide frequency and amplitude (phase, power, power density) measurements. Horizontal bars provide absolute and relative amplitude, (phase, power and power density) measurements.

FFT EXECUTION TIME

100 points in less than 0.05 s.
1000 points in less than 0.5 s.
10000 points in less than 5 s.

REMOTE CONTROL

All WP02 processing functions are fully programmable via the GPIB and RS-232-C interfaces. Simple English-like commands are used.

REMOTE READ AND WRITE

All waveform formats including complex can be read by computer for storage or further processing. Externally generated waveforms can be written into Memories M1 to M4 for FFT or other processing.

STORED FRONT PANELS

Up to 4 front-panel setups, including WP02 menu settings can be stored in non-volatile memory and recalled by the menu buttons at the right side of the screen.

WP02 INSTALLATION

A WP02 package may be retrofitted at any time.

FILTER PASS BAND AND RESOLUTION

Window type	Filter bandwidth at -6 dB [freq. bins]	Highest side lobe [dB]	Scallop loss [dB]	Noise bandwidth [freq. bins]
Rectangular	1.21	-13	3.92	1.0
von Hann	2.00	-32	1.42	1.5
Hamming	1.81	-43	1.78	1.36
Flattop	1.78	-44	0.01	2.96
Blackman-Harris	1.81	-67	1.13	1.71

LeCalsoft–Calibration Software for LeCroy Digital Oscilloscopes

The LeCalsoft package enables a fast and thorough verification of all key specifications.

Main Features

- **Traceability to reference standards**
- **Computer check of key specifications**
- **Computer–aided readjustment**
- **Fully automated configurations available**
- **Supports all 93XX and 94XX models**
- **IBM® PC–AT compatible**

General

The LeCroy LeCalsoft (94XXCS05) test and calibration package provides a convenient, unambiguous check of LeCroy oscilloscopes. Designed for users who require traceability to reference standards (NIST, etc.), this package is ideally suited for use in calibration laboratories where the oscilloscopes are checked at fixed intervals.

Results of the calibration check are fully documented on hard copy, or they can be archived on hard disk or diskette.

LeCalsoft works on any PC compatible with the IBM®–AT standard. It controls the oscilloscope and the calibration sources through a National Instruments® GPIB interface.

Features

Calibration Check

All the essential specifications of the Digital Oscilloscope, such as bandwidth, linearity, noise, trigger, timebase and effective–bit count are tested. Deviations from nominal values are calculated and displayed on the screen, printed, or archived on hard disk or diskette.

Comprehensive Documentation of the Test Results

At the end of each calibration check, two types of documentation are available: a long form printout which gives details of the results of all the tests executed, and states whether or not the results are within the specifications, and a short form printout which gives a summary of the test results.

Calibration Traceable to National Standards (NIST, etc.)

By using signal sources traceable to a standard, the calibration will be traceable to the same standard, provided the relevant documentation is maintained.

Manual and Automated Calibration Check

Both manual operation with computer assistance, and automated operation are possible. Automated operation requires programmable multiplexer and signal sources. See the list of supported devices below.

Assisted Adjustment of the Oscilloscope

A computer–aided adjustment procedure is also provided. By following instructions on the screen, the trained technician is guided through the adjustments required to correct the settings of the oscilloscope so that it is within the specifications.

Calibration Certificate

On request, LeCroy will perform calibration traceable to National Standard Organizations. Calibration certificates are provided as part of this service.

Functional Description

Calibration Practice

LeCroy oscilloscopes are auto–calibrating digital oscilloscopes and therefore do not require regular calibration like analog oscilloscopes. However, for users who require traceability to reference standards (such as those provided by the National Institutes of Standards and Technology), and for calibration laboratories which must inspect incoming instruments and perform recalibration at prescribed intervals, the LeCalsoft computer–aided test and calibration packages provide an easy solution.

Under guidance of the LeCalsoft program, some adjustments to the oscilloscope can be made by an electronics technician. However major deviations from specifications usually require repair by a trained service engineer. LeCroy regularly schedules training classes. If no in–house trained person is available, the nearest LeCroy service center can carry out repairs and calibration, and provide traceability to reference standards.

Using the LeCroy LeCalsoft Packages

For calibration checking, digital oscilloscopes have a great advantage over analog oscilloscopes because waveforms can be transferred to a host computer. This simplifies the calibration procedure enormously, makes it potentially faster and allows an extensive range of tests with unambiguous interpretation of the results.

LeCalsoft performs an extensive series of tests which verify the specifications of the oscilloscope. It includes many tests relevant to analog scopes such as Noise and Linearity tests. Although these tests are difficult and time consuming on an analog oscilloscope, they can be computer controlled and are quickly and easily performed on a digital oscilloscope. Tests which are specific to digital oscilloscopes, such as Sinefit tests are also included.

The various test options in LeCalsoft are presented to the operator in the form of a simple menu system. The user has the choice of performing an automated calibration check of the oscilloscope, or individually testing any of the specifications. Some of the tests require the use of high–quality external signal generators. The user receives instructions on the screen when it is necessary to change the cable connections, but apart from this minor intervention, the tests are fully computer controlled when supported GPIB–programmable instruments are used.

Supported Instrumentation

LeCalsoft software works on any AT–compatible equipped with a math coprocessor and a National Instruments GPIB interface. Automated calibration checking is possible using a set of instruments from the following list. (For an automated calibration check, either the LeCroy or Keithley programmable multiplexer is required to feed the calibration signals to the oscilloscope input.)

RF sinewave generators:
- Marconi 2019A, 2022C, 2030, 2031
- Fluke 6060B, 6061A
- Hewlett–Packard 8642A, 8642B
- Rohde & Schwarz SMX

AF sinewave generators:
- Marconi 2019A, 2022C, 2030, 2031
- Hewlett–Packard 8642A, 8642B
- Rohde & Schwarz SMX
- Tektronix FG5010
- LeCroy AFG 9100

DC Precision Power Supply:
- Tektronix PS5004
- Datron 4708 Autocal Multifunction Standard

Fast Pulse Generator:
- Tektronix CG5001/CG551AP

Power Meters:
- Hewlett–Packard HP436A, HP437B

Multiplexers:
- Keithley 199 SYSTEM DMM/ SCANNER with LeCroy interface board.
- LeCroy 4951, 4973–1, 4973–2 Multiplexers.

Frequency standard:
- WWV or HBG1500

Recommended Accessories

A full kit of calibration connectors and interfaces is available from LeCroy. It includes all the necessary cables, adapters, splitters and filters, as well as the Programmable Multiplexer. Also available is a repair package including special tools, board extenders, etc., for computer–aided adjustment.

Use of Other Instruments

It is possible to perform the calibration check with some other unsupported signal sources. However, the user is then required to set up these instruments manually and to perform one measurement at a time. The LeCalsoft package guides the user step by step, and controls the oscilloscope data acquisition and the computation of the results.

LeCalsoft compares the signal measured by the oscilloscope with the signal it would expect to receive from the generator. Warning messages are displayed whenever tolerances are exceeded. Some of the adjustments may be carried out by the user when the test sequence is finished. In this case, the software will guide the user through the correct adjustment procedure. At the end of the calibration check, a printout can be generated to list the results.

Specifications

Computer Required: Any PC compatible with the IBM–AT standard, and equipped with a mathematical coprocessor and a National Instrument Inc. GPIB interface.

Operating System: DOS 3.0 upward

Medium: $3^1/_2$" 1.44 Mb
$5^1/_4$" 1.2 Mb diskette

Major Tests Supported by LeCalsoft

Internal

To ensure proper calibration of the oscilloscope, internal auto–calibration tests are automatically executed during normal operation. This standard sequence of internal auto calibration tests is initiated by the software and the results are transferred to the PC for analysis.

The tests are:

- Calibration of the resolution of the time–to–digital converter with respect to the system clock
- Determination of the gain constants of the input amplifiers
- Offset compensation versus gain variation
- Global internal non–linearity
- General functionality check

Bandwidth

To calculate the bandwidth, the amplitudes of sine waves of increasing frequencies are measured. The sine wave generator is first set to 500 kHz with an amplitude 75% of full screen, i.e. ±3 vertical divisions. The frequency is then swept up to the point where an amplitude drop of 3 dB is observed. This indicates the bandwidth.

This test is executed on all channels for 1 MΩ and 50 Ω input impedance and for all vertical sensitivities. It requires a sine wave generator with good flatness.

Generators supported under program control are listed on page 2.

Linearity

15 different known voltages, varying from 5% to 95% of full screen, are applied by the external voltage reference source. For each voltage value, a full waveform is acquired, and the mean value is compared to the known input voltage. The linearity is determined through a linear regression fit to the 15 measurements.The slope, the offset and the chi–square of the fit are computed.

With the linearity test, many other related tests are performed: response time of the overload protection of the 50 Ω input, linearity of the variable gain calibration, range and linearity of the offset setting, and quality of the input coupling.

This procedure is executed on all channels for both 1 MΩ and 50 Ω input impedance. The test requires a DC source with a precision and time stability of 0.1%, a voltage range of 0 V to 20 V adjustable in steps of 5 mV, and an output current capability of 300 mA.

Power supplies supported under program control are listed on page 2.

Noise

The noise tests are executed on all channels for both 1MΩ and 50 Ω input impedance, with AC and DC coupling, five different time–base settings, and open inputs. Full waveforms are acquired with different offset values. The peak–to–peak as well as the RMS values of each measurement are computed, and the maximum values are recorded. The program also indicates the occurrence of any "flyers", i.e. short noise peaks generated by the ADC's.

The noise tests also include:

- checking the linearity of the variable offsets of all channels between 2.5% and 97.5% of full screen.
- checking the stability of the ground line when switching the inputs between GROUND and DC coupling modes.

Rise time/Overshoot

Executed on all channels for both 1MΩ and 50 Ω input impedance, these tests measure the rise time of the oscilloscope response to the input voltage step, as well as the amount of pre–shoot and overshoot. They require a voltage step generator with calibrated fast rise–time amplitude.

The Voltage Step Generator supported under program control is the Tektronix CG5001.

Sinefit

The performance of the analog–to–digital converter is evaluated in terms of the number of effective bits (a measure of the signal–to–noise ratio). It is measured on all channels, at a sensitivity of 50 mV/div., by applying a pure sine wave at varying frequencies and timebase settings

This test is a measurement of dynamic linearity. It shows the effect of such errors as noise, non–linearities and aperture jitter.

Timebase

The timebase test compares the internal clock with a very precise and stable external timebase reference (clock generator) such as the WWV standard or HBG 1500.

Trigger

The trigger capabilities are tested for all possible configurations. These include:

- Internal and external trigger sources
- DC, AC, HF–reject, and LF–reject couplings
- Trigger level settings in all slope modes.

ORDERING INFORMATION

LeCalsoft and Options

94XXCS05	Complete LeCalsoft for 93XX and 94XX (software and hardware), incl. cables, switch card, adapters, etc.
94XXCS01	LeCalsoft software for 93XX and 94XX
9400CS01	Calsoft software for 9400A

LeCalsoft Accessories

4.1 F9300-1 or F9314M-1 Processor Board

The processor board is based on to the 68020 and 68881 coprocessor, with a clock frequency of 16 MHz.
The internal Data Bus is 32 bits wide, the peripherals Data Bus 8 or 16 bits, and the Address Bus has 27 bits (A0-A25 and A31).
Depending of the scope configuration, two versions are used:

1 Mbyte memory : F9300-1 (9310, 9314)
2 Mbytes memory : F9314M-1 (9310M/L, 9314M/L)

The board contains the following sections:

Program memory (EPROM)

768 Kbytes: 2 x 2 Mbit Eproms and 2 x 1 Mbit Eproms.
Data Bus : 16 bits.
Address : 0000 0000 to 000D FFFE.

Working memory (PS RAM)

F9300-1, 1 Mbyte memory : 2 Pseudo static RAM of 4 Mbit.
F9314M-1, 2 Mbytes memory : 4 Pseudo static RAM of 4 Mbit.
Data Bus : 16 Bits.
Address : 0040 0000 to 004F FFFE or 005F FFFE.

Memory card

An interface is implemented to support an external memory card.
From 16 Kbytes to 512 Kbytes.
Data bus: 8 bits.

Non volatile memory

A static RAM of 8 Kbytes contains the default parameters used during power on to initialize the scope. This memory is battery backed up.
Data bus: 8 bits.

Min/Max calculation

A gate array MNX401 makes a histogram in its associated 16 Kbytes memory by using the minima and maxima.
Data bus: 16 bits.

Graphic processor

The graphic processor of the raster scan display is a gate array designated MDS410.

- Clock frequency : 48 MHz.
- Trace and characters memory : 32 Kbytes (CTRAM).
- Bitmap memory : 40 Kbytes (BMRAM).
- Character font EPROM : 32 Kbytes (FCRAM).
- Data bus : 8 bits.

DAC command of the display intensity

The command of the RAMDAC is done by a 8 bits RAMDAC.

Status and command registers

Status (read) and command (write) registers control the memory card and front panel interface during the boot or after a RESET.

External interfaces

Serial RS232 interface
Parallel GPIB interface
See F9300-4 Description Section 4.3

Optional interfaces

Graphic Printer : F9300-6 interface and F9300-7 controller
Floppy Disk Drive : F9300-6 interface
Centronics : F9300-6 interface

Serial peripherals

The processor controls the digital and analog section with a double serial controller.

- DAC's registers (read/write).
- Front panel registers (68HC05C4).
- RTC registers (68HC68T1).
- Probe detection.
- Software options (GAL).
- Front end control.
- Trigger control (MTR408).

Real time clock

Integrated circuit 68HC68T1 (Motorola or RCA).

- Resolution : 1 sec to 99 years.
- Clock frequency : 32.768 KHz.
- Non volatile memory : 32 Kbytes.
- Data and Address bus : 8 bits.
- Interrupt level : 5.

4.2 F9310/M/L-3 Main Board

4.2.1 Introduction

The board is divided into seven parts:

- Microprocessor control.
- Front end control.
- Trigger control.
- Channel 1, Channel 2 front ends.
- Channel 1, Channel 2 ADC's.
- Time base.

4.2.2 Front End

4.2.2.1 Serial Commands of Gain and Coupling

Send by the processor in a 16 bits word.
Address: Channel 1 0141 2000
Channel 2 0141 3000

4.2.2.4 Overload

The overload reading is done in two steps:
- Read the byte at address 0140 5000. If MSB=1 an overload is detected.
- Read the byte at address 0140 4000.

MSB LSB

												OVL CH4	OVL CH3	OVL CH2	OVL CH1
-	-	-	-	-	-	-	-	-	-	-	-				

OVL : CH1 = 1 Overload channel 1 CH2 = 1 Overload channel 2

4.2.2.5 Analog Control

The analog controls are sent from a 16 bits DAC, multiplexed in 12 Sample & Hold, and refreshed every 512 µsec.
The DAC range is +/- 10 V.

DAC 0000 = +10 V
DAC 7FFF = 0 V
DAC FFFF = -10 V

Channel 1		Channel 2
0300 0008	VAR.GAIN (IVG1)	0300 000C

0300 0052

VTH = DAC/20

Calibration

0300 0014 Calibration
0300 0054

CAL OUT = DAC/Attenuator factor

4.2.3 ADC

Depending on the 9310 model, the ADC has the following configuration:

DSO model	Board	ADC Memory	Buffer Memory
9310	F9310-3	10 Kbytes	no
9310M	F9310M-3	50 Kbytes	64 K/16bits
9310L	F9310L-3	1 Mbytes	64 K/16bits

Each channel has an ADC section with Sample & Hold (HSH410), 8 bits FLASH ADC converter, and acquisition memory.

Address:
0280 0000 ADC memory channel 1
02A0 0000 Buffer memory channel 1 *
02C0 0000 ADC memory channel 2
02E0 0000 Buffer memory channel 2 *

* Not for 9310 scope

The MIN/MAX calculation is done by the MNX401 on the processor board.

4.2.4 Time Base

- 100 Ms/s sampling frequency.
- 1 Mbytes acquisition memory addressing.
- 70 ns acquisition memories in two blocks.
- 10 ps resolution SMD interpolator.
- 400 MHz START/STOP oscillator for the "Trigger width" and "Trigger on interval" modes.
- SMART trigger with window capability.
- Real time TDC measuring the trigger time position.

4.3 F9300-4 GPIB and RS 232 Interface

This board is connected to the processor F9300-1 or F9314M-1 through a flat cable . Data bus is 8 bits, address bus: 12 bits.
Address 0180 000 to 0180 00FF.

4.3.1 RS 232 Serial Interface

Based on the 2661A IC from Signetics or Philips.

- Clock frequency 4.9152 MHz.
- 4 internal registers of 8 bits.
- Interrupt level 2.
- Connector type DB9 with 9 male pins.

4.3.2 GPIB Interface

Based on the circuit 7210 IC from NEC.

- Clock frequency 5 MHz.
- 8 internal registers of 8 bits.
- Tri-state external GPIB drivers.
- Low level output.
- Interrupt level 3.

The GPIB address is set by software and stored in non-volatile memory.

4.4 F9310-5 Front Panel

The front panel is connected to the processor board with a flat cable. Power supply and control signals are supplied from the processor. The front panel is divided in two sections:

- One board with Motorola 68HC05C4 processor, coders, and serial data interface.

- One matrix Keyboard with push buttons.

4.5 F9300-6 Centronics, Floppy, Printer interface option

4.5.1 Centronics interface option

This Centronics interface makes direct connection possible to external parallel printer.

- Address 0130 0180 to 0130 01A0
- Interrupt level 2

4.5.2 Floppy Disk drive interface option

Based on the circuit MCS3201 from Motorola.

- Address 0130 01C0 to 0130 01C7
- Interrupt level 4

Address	Read	Write
0130 01C0	Input register	-----
0130 01C2	-----	Digital output register
0130 01C4	Main status register	-----
0130 01C5	Data register	Data register
0130 01C7	Data input register	Disk control register

4.5.3 Printer Interface option

Internal graphic printer : Seiko LPT5446

- Address 0130 0140 to 0130 0160
- Interrupt level 2

4.6 F9300-7 Printer Controller option

Based on the LPT5000 series control chip set from Seiko instrument Inc

- PT501P01 CPU
- PT500GA1 Gate array
  Technical reference 39019-2234-01

- Address 0130 0100

4.7 93XX-Display

4.7.1 General Description

The raster scan display module is divided into five sections:

- Graphic processor
- Deflection
- Video
- Yoke
- Cathode ray tube

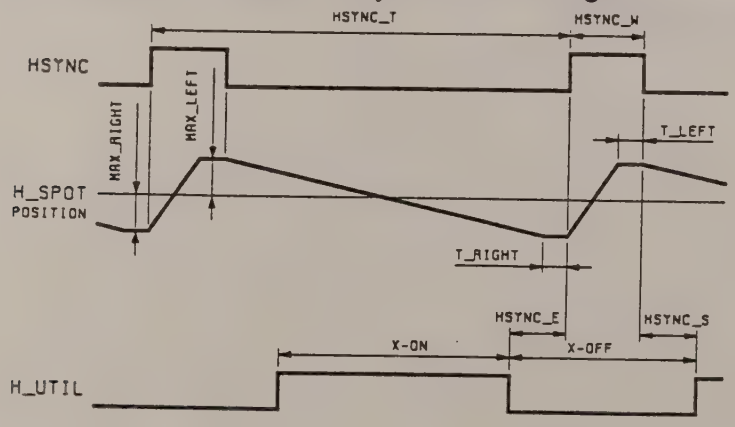
4.7.2 Basic Characteristics

- Nine inches diagonal monochrome, yellowish, orange.
- CRT anti-glare treated
- Non interlaced resolution of (X)810 x (Y)696 pixels at 60 Hz frequency.
- Landscape vertical raster
- Electromagnetic deflection.
- Intensity control rise and fall time > 12 ns.
- Analog intensity input
- TTL synchronization input.
- Horizontal nominal size: 165 mm for X-on = 15.39 Ms.
- Horizontal size adjustment: > +/- 5 mm.
- Horizontal offset adjustment: +/- 5 mm.
- Vertical nominal size: 120 mm for Y-on = 14.5µs.
- Vertical size adjustment: > +/- 5 mm.
- Vertical offset adjustment: +/- 5 mm.
- X and Y differential non linearity: 10%.

The line deflection is vertical, from bottom to top. The field deflection is horizontal, from left to right and is resynchronized to the power line frequency.

4.7.3 Horizontal Deflection

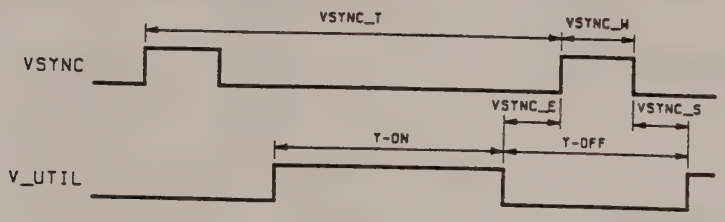
The horizontal deflection is synchronized to the 50 or 60 Hertz power line frequency. The on time display is the same for both frequencies, therefore the deflection is calculated for 60 Hz. The horizontal deflection is controlled by the HSYNC signal.



The trailing edge of HSYNC resets the horizontal spot position to a hardware predefined position at the left side of the screen: MAX_left. When ever HSYNC is high, the spot stays at this position.
The falling edge of HSYNC starts the horizontal deflection ramp. The ramp has the same rate for either 50 or 60 Hertz frequency.
When ever HSYNC is low, the horizontal deflection will rise left to right, until HSYNC becomes high, or the system has reached the maximum right position (MAX_RIGHT).

4.7.4 Vertical Synchronization

The whole timing of both VSYNC and HSYNC is synchronized to the pixel clock (PCLK).
The pixel rate is 48 MHz.



4.7.5 Horizontal and Vertical Resolution

	# OF V-LINE	TIME in ms
HSYNC_T	842	15.998
HSYNC_W	22	0.418
HSYNC_E	4	0.076
HSYNC_S	6	0.114
X-ON	810	15.390
X-OFF	32	0.608

Values for the horizontal timing for the maximum field refresh frequency.
Vertical timing.

	# OF PIXELS	TIME in us
VSYNC_T	912	19.000
VSYNC_W	136	2.833
VSYNC_E	0	0.000
VSYNC_S	80	1.666
Y-ON	696	14.500
Y-OFF	216	4.500

4.8 93XX-PS1715 Power Supply Specifications

Input voltage	: 90 to 132 V or 180 to 250 V. Auto ranging line voltage.
Input frequency	: 45 Hz to 66 Hz.
Input rush current	: Max 40 A peak at start up.
Environmental	: Operating temperature range 0^{o} to $55^{o}C$ Storage temperature range -20^{o} to $85^{o}C$ Relative humidity from 5% to 95%.
Shock vibration	: MIL-STD-810D MIL-T-28000C paragraph 4.5.5.4.2
Output voltages	: - 5.2 Vdc, 8 amp Max. + 5.2 Vdc, 4.5 amp Max. -15.1 Vdc, 4.5 amp Max +15.1 Vdc, 4.5 amp Max.
Output adjustment	: +/- 5%.
Regulation	: +/- 1%.
Transient response	: -5.2 V < 400 mV. +5.2 V < 250 mV. +/- 15.1 V < 1.5 V. Maximum recovery time 1.5 msec.
Ripple and noise	: Peak to peak value < 1%. Line frequency rejection < 5 mV.
Overshoot	: < 5% at start up.
Hold up time	: 20 msec.
Output short circuit protection	: Yes.
Output overvoltage protection	: No.
Input protection	: 5 amp fuses.
Thermal protection	: Yes.
Safety	: VDE 0806, IEC 380, UL478, CSAC22.2#154
EMI	: VDE 0871 class B, FCC 20780 part 15j class B.
MTBF	: 80.000 hours.

5.1 Turn On

Switch on the power using the power switch on the rear panel.
Check:

That the display turns on after about 10 seconds.
That the display is stable.
That the range of intensity and grid intensity is reasonable.

Wait for about 10 minutes for the scope to reach a stable operating temperature.

5.2 Noise on the Inputs

This is to verify the proper operation of the main board (front end, ADC's, TDC).

5.2.1 Channel 1, Channel 2 : 1 MOhm DC

With no signal connected to the inputs, set up the DSO as follows:

- Turn on traces : Ch1 and Ch2.
- Display setup : Standard, Persistence off, Single grid
- Input coupling : Ch1, Ch2 : 1 MOhm DC.
- Input gain : 5 mV/div.

- Trigger setup :
  - Trigger on : Line
  - Slope line : Positive
  - Mode : Norm

- Timebase : 10 msec/div
- Global BWL : Off
- Probe attenuator : X1

- Cursors/Measure : Parameters
- Mode : Custom
- Statistics : On
- Change Parameters :

  - On line 1 : Measure pkpk of Ch1
  - On line 2 : Measure pkpk of Ch2
  - On line 3 : Measure sdev of Ch1
  - On line 4 : Measure sdev of Ch2

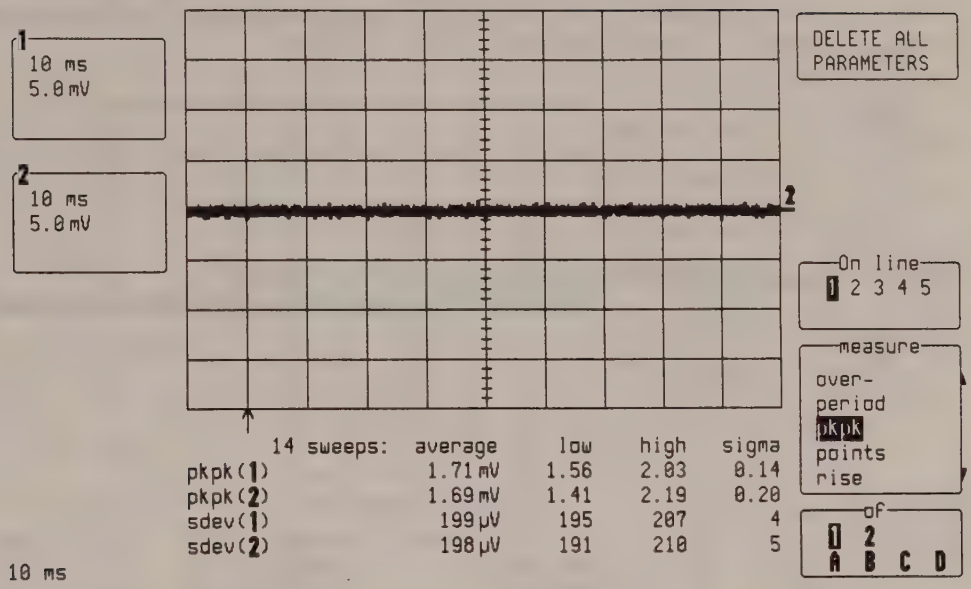
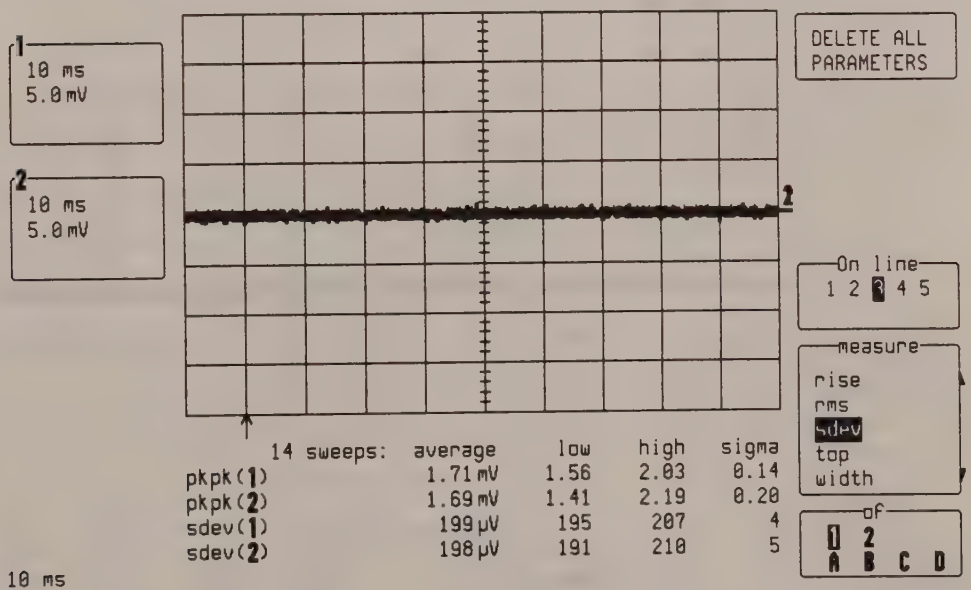
Check : pkpk is less than 3.6 mV.

Check : sdev is less than 360 µV.

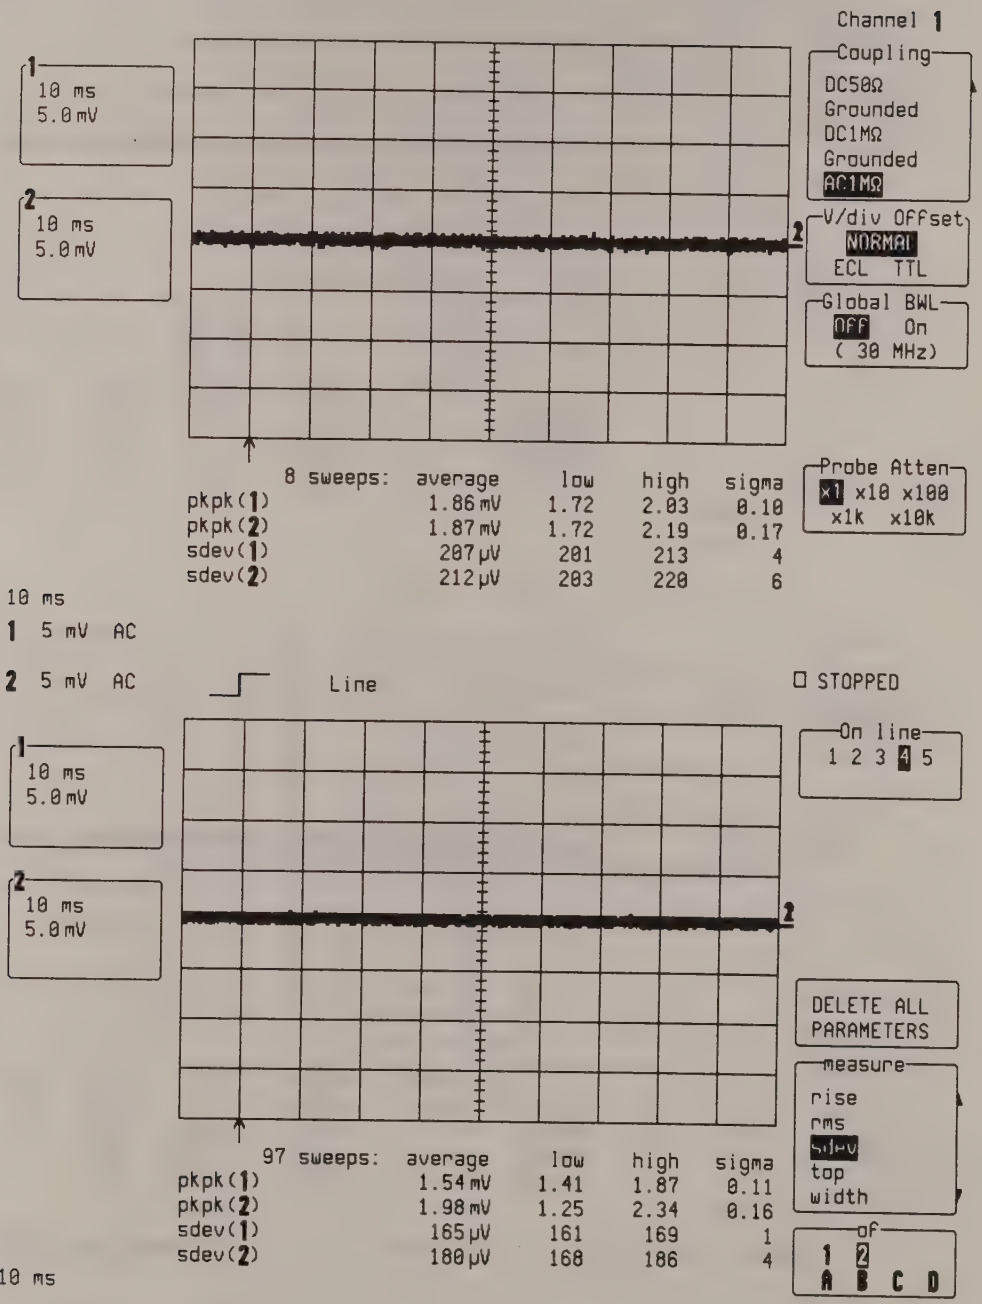




Repeat the tests for Timebase 5, 2, 1, .5 msec/div and check as above.

5.2.2 Channel 1, Channel 2 : 1 MOhm AC

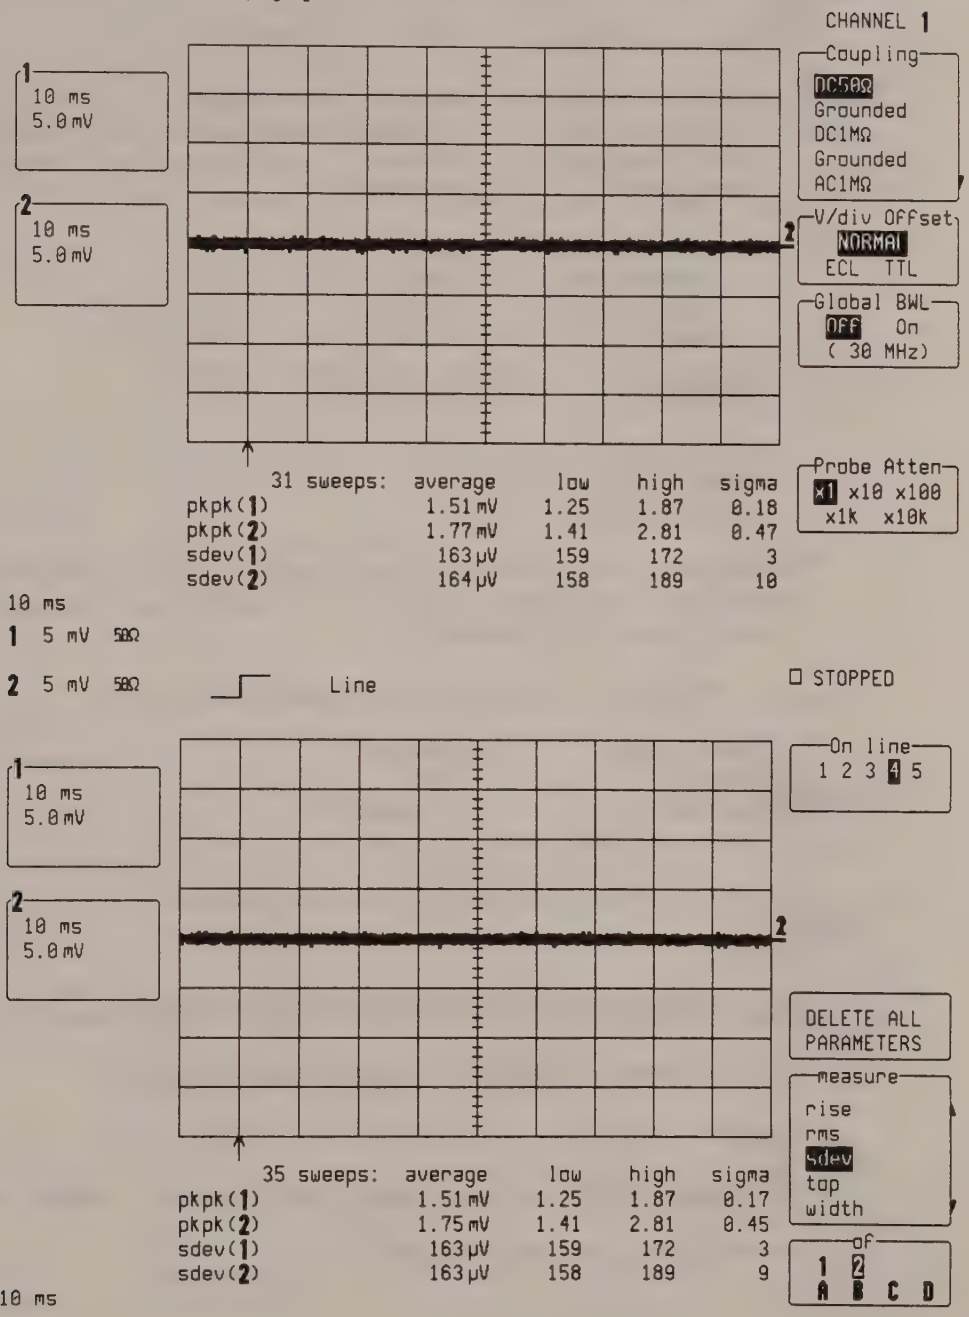
Set Channel 1 and Channel 2 input coupling to 1 MOhm AC.
Check : sdev < 360 µV, pkpk < 3.6 mV.



Repeat the tests for 5 msec, 2 msec, 1 msec and .5 msec/div.

5.2.3 Channel 1, Channel 2 : 50 Ohm DC

Set Channel 1 and Channel 2 input coupling to 50 Ohm DC
Check : sdev < 360 µV, pkpk < 3.6 mV.



Repeat the tests for 5 msec, 2 msec, 1 msec and .5 msec/div.

5.3 Channel 1, Channel 2 : Offset

Set up the DSO as follows:

- All inputs open :

- Turn on traces : Channel 1 and Channel 2.
- Display setup : Standard, Persistence off, Single grid.
- Input coupling : Channel 1 and Channel 2, 1 MOhm DC.
- Input gain : 50 mV/div.

- Trigger setup : Edge
  - Trigger on : Line
  - Slope line : Positive
  - Mode : Norm

- Timebase : 10 µsec/div

- Global BWL : Off
- Probe attenuator : X1
- Cursors/Measure : Off

Using the offset control, move the Ch1 trace slowly through the entire range and check that there is no significant change in the displayed trace. Repeat for Channel 2.

Set the Digital Storage Oscilloscope as follows :

- Input gain : 5 mV/div
- Offset : Zero
- Timebase : 50 µsec/div

Switch between coupling 50 Ohm and Grounded,

Check:

The trace should not move more than 1 mV or a minor division.

Switch between coupling 1 MOhm DC and Grounded,

Check:

The trace should not move more than 1 mV or a minor division.

Repeat the tests for Channel 2.

5.4 Input Impedance

The input impedance should be 50 Ohm ± 1% and 1 MOhm ± 1%.
See Front end Calibration procedure for further detail.

5.5 Bandwidth at 50 Ohm input impedance

The purpose of this test is to ensure that the entire 9310 system has a bandwidth of at least 300 MHz at 50 Ohm input impedance.

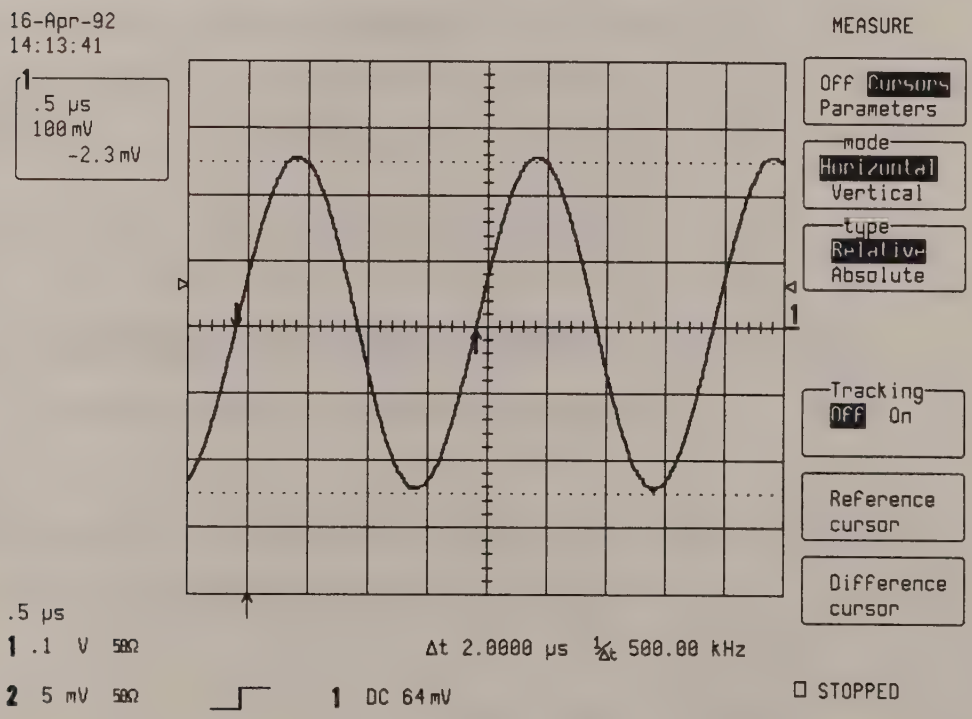
Set up a leveled sine wave generator (for example Marconi 2030):

- Frequency : .5 MHz

Connect the generator output to Channel 1 input.

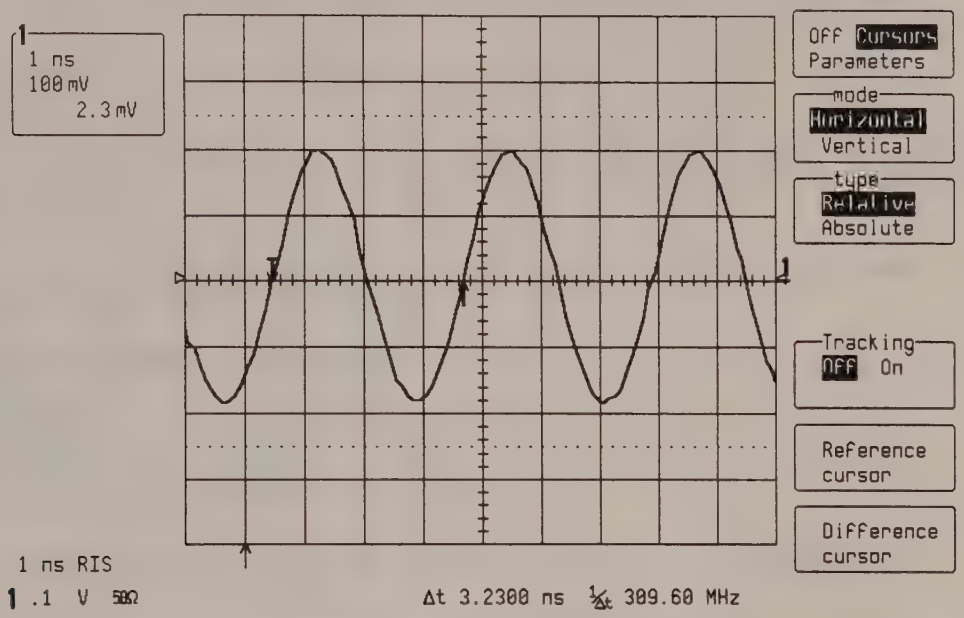
- Input coupling : 50 Ohm
- Input gain : 0.1 V/div
- Timebase : 0.5 µsec/div
- Trigger setup : Edge, Channel 1, DC, Pos, Norm
- Global BWL : Off

Adjust the generator output amplitude and Ch1 offset to get a 5 divisions peak to peak sine wave.

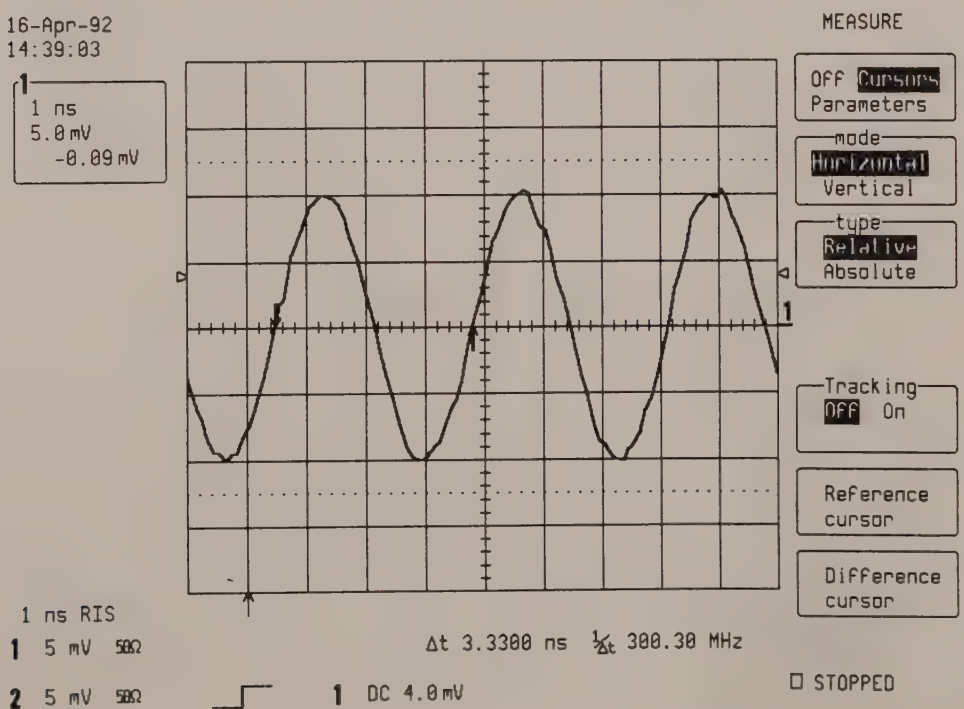


Increase the generator frequency, while decreasing the time/div until the sine wave peak to peak amplitude is .7 x 5 divisions = 3.5 divisions (3dB point) or 70% of the initial amplitude at .5 MHz.

Check : The frequency of the generator must be at least 300 MHz.

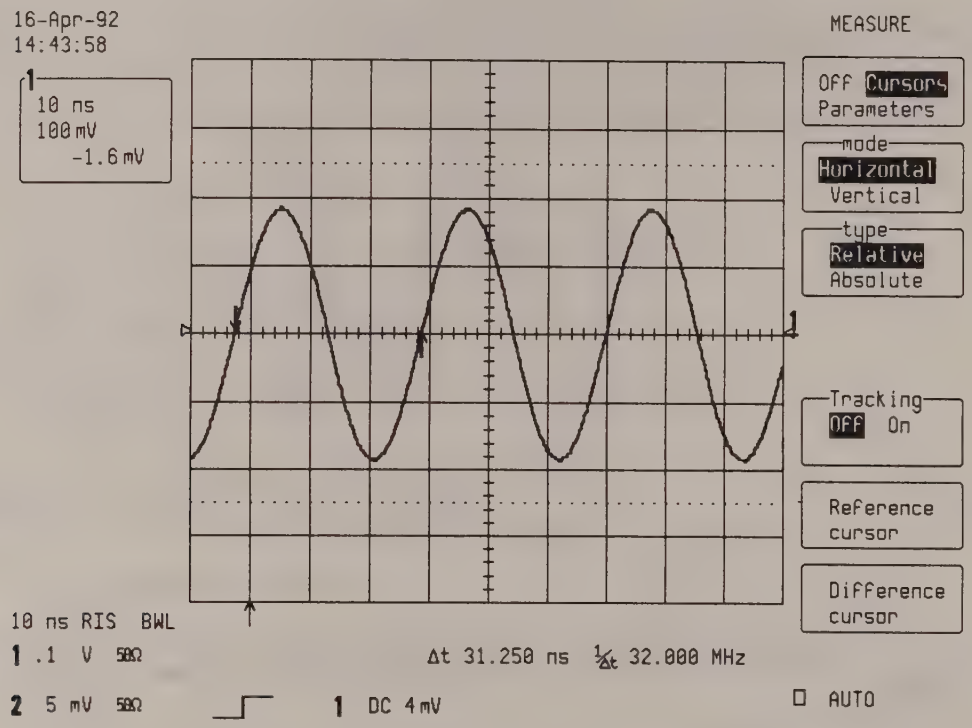


Repeat the above test for input = 50 mV, 20 mV, 10 mV and 5 mV/div. Check at 5 mV/div that the bandwidth is at least 270 MHz.



Set the bandwidth limiter on.

Check that the frequency of the generator at the 3dB point is between 22 MHz and 43 MHz.



Repeat all the tests for Channel 2.

5.6 Bandwidth at 1 MOhm Input Impedance

The purpose of this test is to ensure that the entire 9310 system has a bandwidth of at least 250 MHz at probe tip.

Set up a Tektronix SG503 leveled sine wave generator or equivalent.

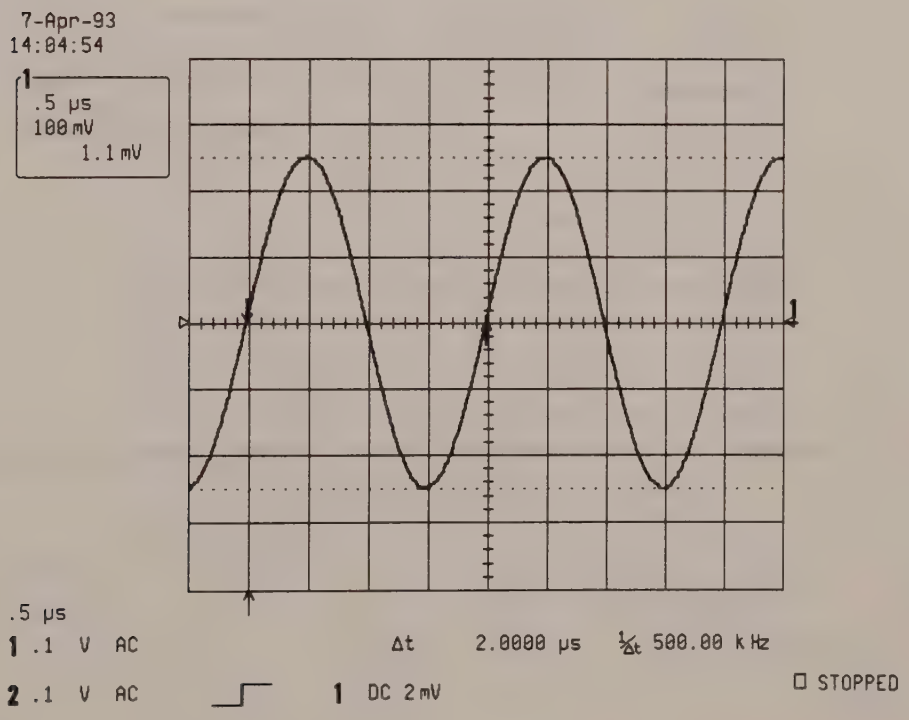
- Frequency : .5 MHz
- Amplitude : 5V peak to peak

Terminate the output of the SG503 via a 50 Ohm feedthrough and connect it to the channel 1 input through a 10X-probe using the probe tip BNC Jack adapter.

Make sure the probe is perfectly adjusted, low frequency and high frequency (see brochure enclosed with probe).

- Input coupling : 1 MOhm/AC
- Input gain : .1 V/div
- Timebase : .5 µs/div
- Trigger setup : Edge, Ch1, DC, Positive, Norm
- Global BWL : Off
- Probe attenuator : X10

Set the SG503 output amplitude and the Ch1 offset to provide a 5 divisions peak to peak sine wave.

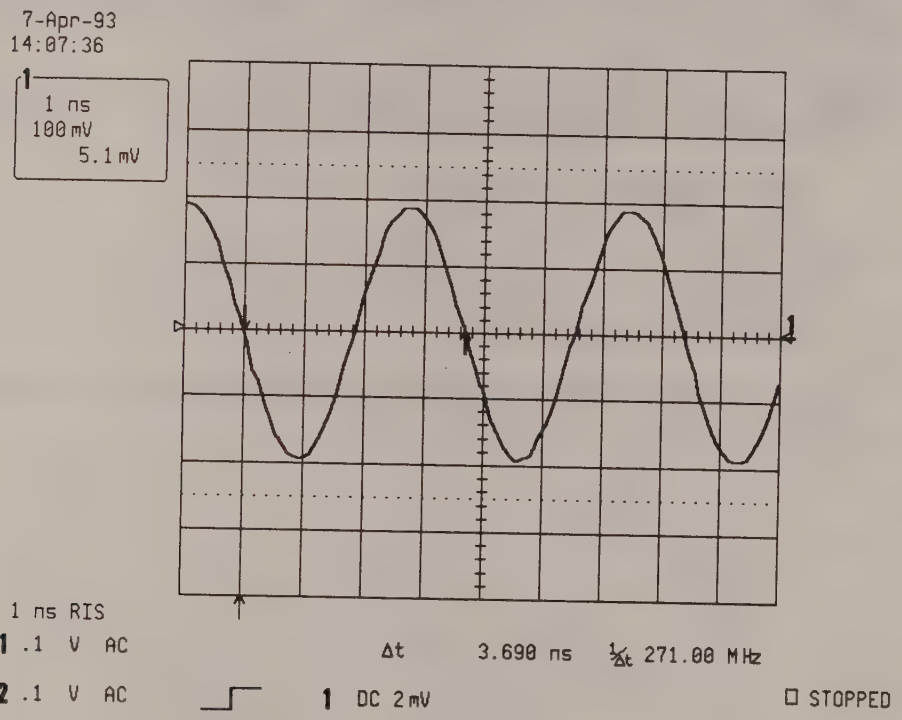


Increase the SG503 frequency, while decreasing the time/div until the sine wave peak to peak amplitude is :

.7 x 5 divisions = 3.5 divisions (3 dB point) or 70% of the initial amplitude at .5 MHz.

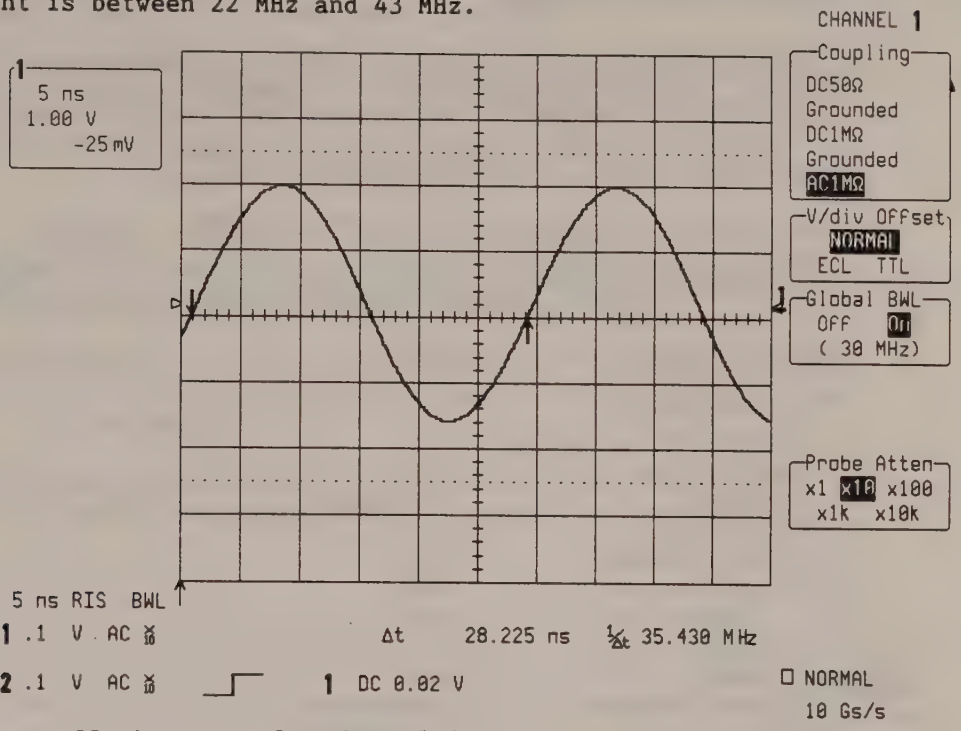
Check :

The frequency of the SG503 must be at least 250 MHz.

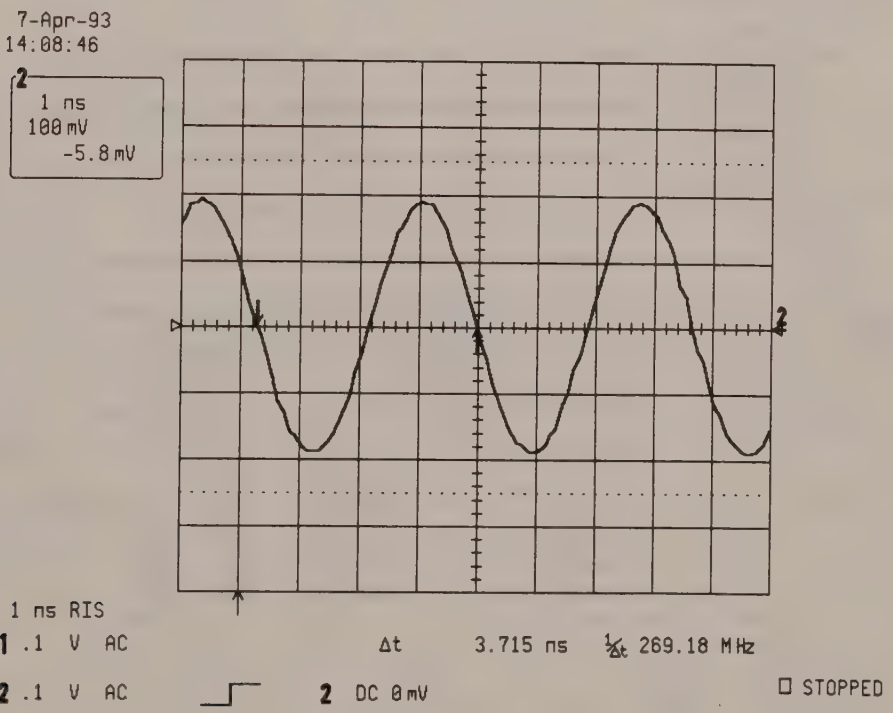


Repeat the above test for input = 50 mV, 20 mV, 10 mV, and 5 mV/div.

Set the bandwidth limiter on, and check that the frequency at the 3 dB point is between 22 MHz and 43 MHz.



Repeat all the tests for Channel 2.



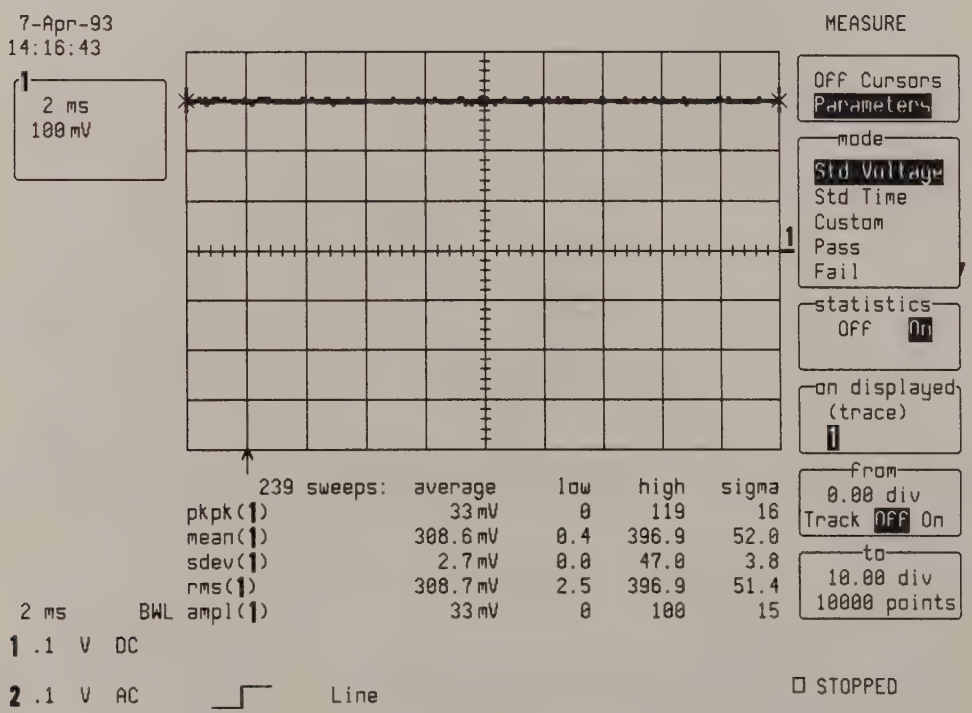
5.7 Manual Linearity Test using an External High Precision Voltage Source (NIST Traceable)

In the absence of the Computer Automated Calibration System based on LeCroy Calibration software (LeCalsoft) for the 9310 model oscilloscope, the manual performance test procedure can be followed to establish a NIST traceable calibration, provided the measurement instruments used are NIST traceable calibrated.

For a NIST calibration, follow the manual linearity test procedure using a calibrated and certified high precision (better than 0.1%) voltage source, for example TEK PS5004 supported by LeCalsoft.

Manual linearity test procedure

- Set scope to:
- Channel to be tested : On
- Input offset : 0 mV
- Timebase : 2 msec/div
- Global BWL : On
- Probe attenuator : X1
- Trigger setup : Edge
  - Trigger on : Line
  - Slope line : Positive
  - Mode : Norm
- Cursors/Measure : Parameters
- Mode : Std Voltage
- Statistics : On



For each V/div and both 50 Ohm and 1 MOhm DC coupling and for all channels separately, check the following:

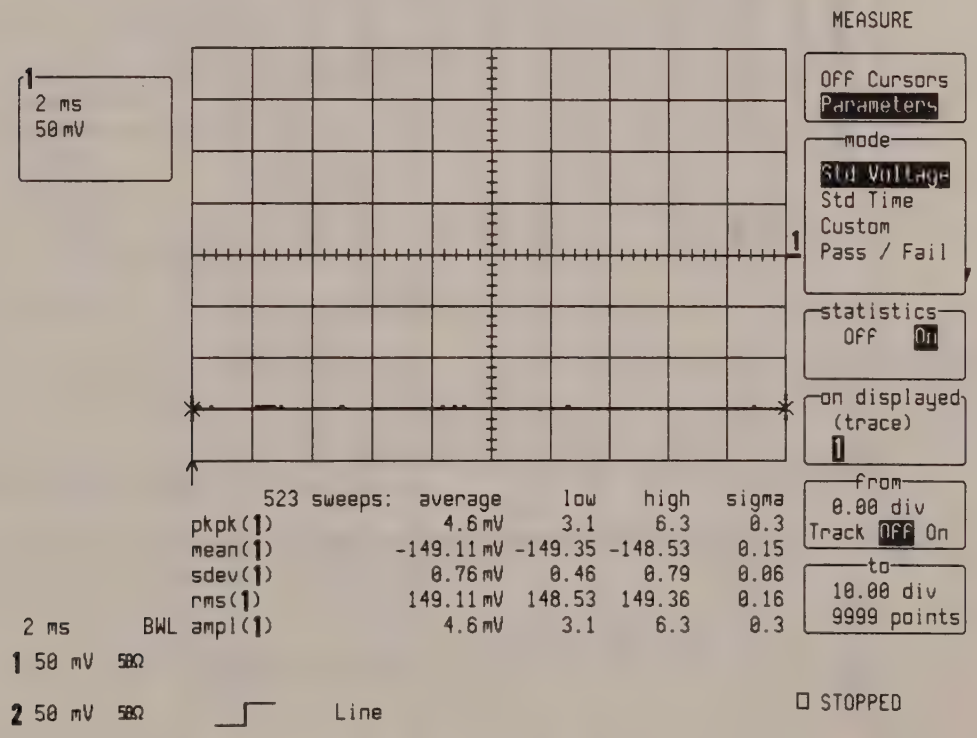
From the high precision voltage source, apply the following 3 voltage values, one after another, to the channel to be tested:

+ 3 major screen divisions
0 " " "
- 3 major screen divisions

For each point, read off the " Mean " parameter voltage, and compare to the digital read-out of the voltage reference.

The difference of the two values in mV or V, should be within 2%, 3% or 5% of full scale of the scope, depending of the sensitivity. See table on page 16.

For the low sensitivities : 2 mV, 5 mV, 10 mV, 20 mV and 50 mV/div, use a 50 Ohm 20 dB attenuator or 1 MOhm 20 dB attenuator.



Range	50Ω Test	1MΩ Test	Test of Conditions			Limit	Reading Mean parameter	
Volt/div	20 dB attenuator	20 dB attenuator	Power supply output	Scope input	Scope full scale	Tolerance % of full scale	Min value	Max value
2 mV	YES	YES	± 60 mV	± 6 mV	± 16 mV	± 5%	± 5.2 mV	± 6.8 mV
5 mV	YES	YES	± 150 mV	± 15 mV	± 40 mV	± 3%	± 13.8 mV	± 16.2 mV
10 mV	YES	YES	± 300 mV	± 30 mV	± 80 mV	± 2%	± 28.4 mV	± 31.6 mV
20 mV	YES	YES	± 600 mV	± 60 mV	± 160 mV	± 2%	± 56.8 mV	± 63.2 mV
50 mV	YES	YES	± 1.5 V	± 150 mV	± 400 mV	± 2%	± 142 mV	± 158 mV
.1 V	NO	NO	± 300 mV	± 300 mV	± 800 mV	± 2%	± 284 mV	± 316 mV
.2 V	NO	NO	± 600 mV	± 600 mV	± 1.6 V	± 2%	± 568 mV	± 632 mV
.5 V	NO	NO	± 1.5 V	± 1.5 V	± 4 V	± 2%	± 1.42 V	± 1.58 V
1 V	NO	NO	± 3 V	± 3 V	± 8 V	± 2%	± 2.84 V	± 3.16 V

Figure 5.1

5.8 Trigger Level

Set up any sine wave generator, capable of generating sine waves to 500 Hz, for example Intron IFG-422 or Topward TFG-8101:

- Frequency : 500 Hz

Connect the output of the generator to Channel 1.

Set up the DSO:

Turn off all the traces except Ch1.

- Trigger setup : Edge
  - Trigger on : Ch1
  - Coupling : DC
  - Mode : Norm
  - Slope : Positive
  - Delay : 50% Pretrigger
  - Level : 0.0 mV

Set the input CH1:

- Coupling : 1 MOhm, DC
- Global BWL : Off
- Probe atten : X1
- Gain : .5 V/div
- Offset : Zero

Set the time base:

- Time/div : .2 msec/div

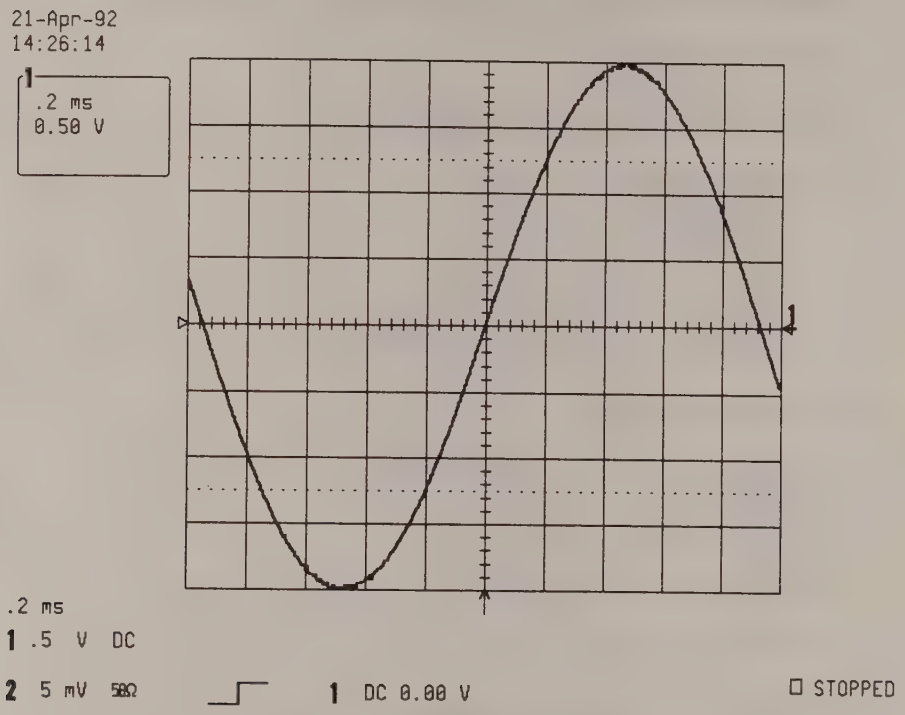
Adjust the sine wave generator's output amplitude to get 8 divisions p-p, corresponding to a 2 V amplitude.

It is important that the offset of the input is set to zero mV, (use panel status to verify).

Use the offset adjustment of the sine wave generator to center the signal with respect to the screen.

Check:

The sine wave must pass through the horizontal center of the screen
(50% Pretrigger line) at the vertical position zero,
(vertical center) within ± 2 minor divisions.



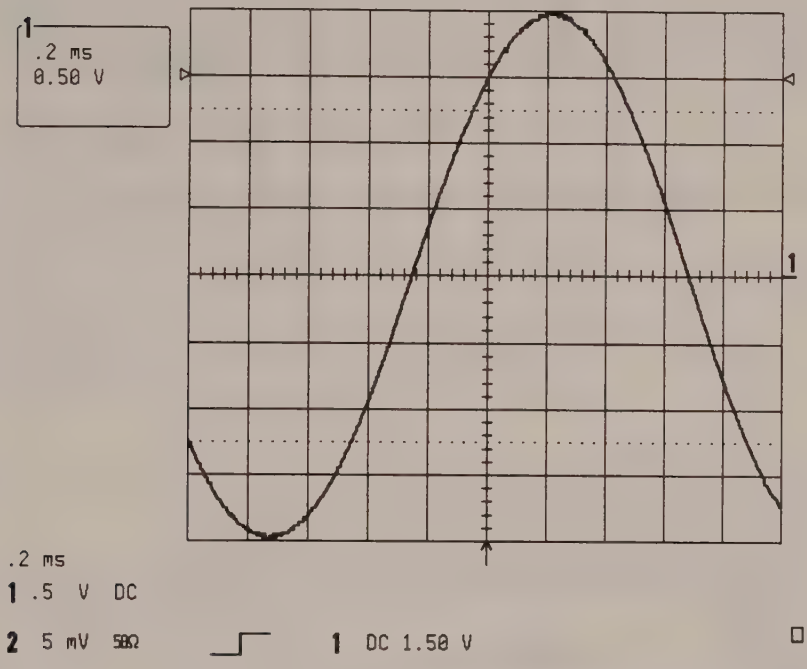
Repeat the test for the following conditions:

- Trigger slope Pos and Neg (verify slope at check point)
- Trigger coupling DC, AC, HFrej

Set the trigger level to + 1.5 V.

Check:

The sine wave must pass the horizontal center at + 3 divisions within ± 2 minor divisions.

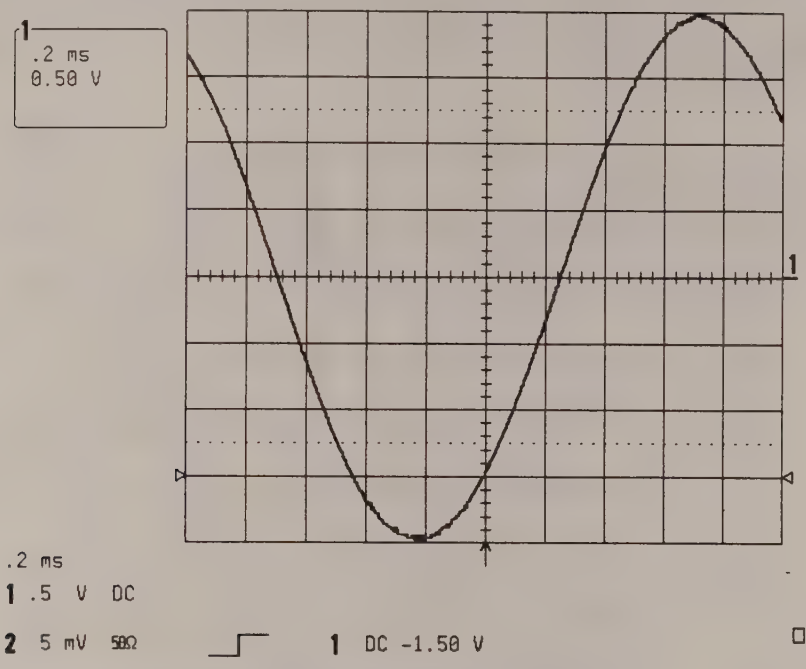


Repeat the test for the following conditions:

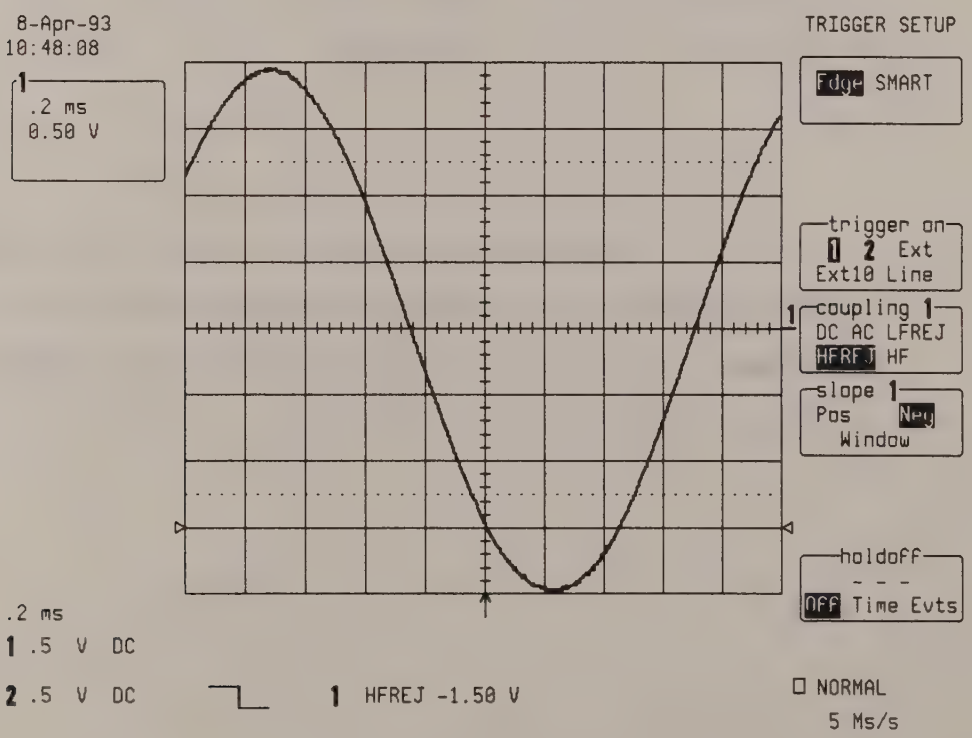
- Trigger slope Pos and Neg (verify slope at check point)
- Trigger coupling DC, AC, and HFrej

Set the trigger level to - 1.5 V.

The sine wave must pass the horizontal center at - 3 divisions within ± 2 minor divisions.



Repeat the test for the following conditions:
- Trigger slope Pos and Neg, Trigger coupling DC, AC, and HFrej



Disconnect the input from Channel 1 and connect it to Channel 2.

- Turn on trace for Channel 2.

- Set the trigger source to Channel 2.

Repeat the above check procedure for Ch2, trigger slope positive and negative, trigger coupling DC, AC, HFrej.

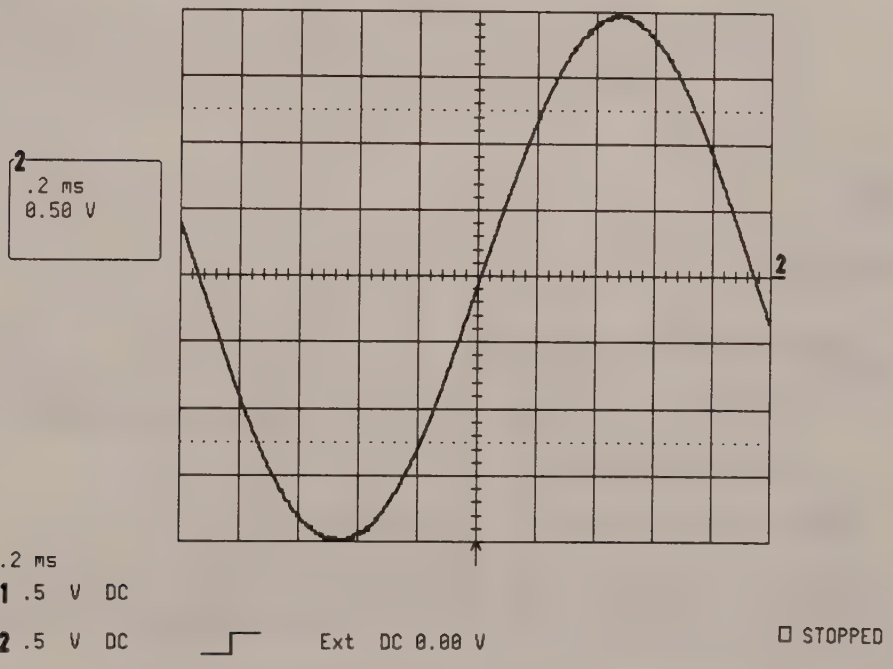
Connect the output of the generator to Ext input and to Ch2 via a coaxial T-connector. The cable length from Ext to Ch2 must be short, at most 2 nsec.

- Set trigger source to Ext.

Repeat the above check procedure for Ext trigger, but observing the effect on Channel 2.

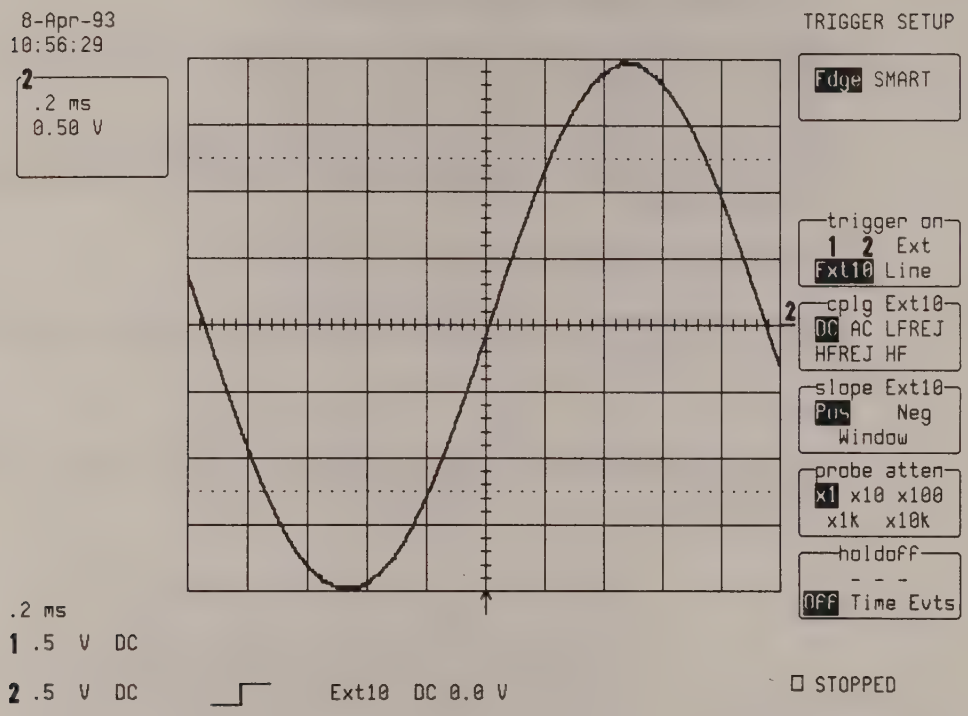
Check:

The sine wave must pass the horizontal center within ± 2 minor divisions.



Repeat the above check procedure for Ext trigger / 10.

The tolerance for the level crossing is ± 3 minor divisions.



5.9 Bandwidth for Ext Trigger

Set up a sine wave generator (for example Marconi 2030):

- Frequency 300 MHz

- Amplitude 2.8 V p-p (maximum for Marconi)

Connect the output of the generator to Ext input and to Ch2 using a coaxial T-connector. The cable length between Ext and Ch2 must be short (at most 2 nsec).

Set up the DSO:

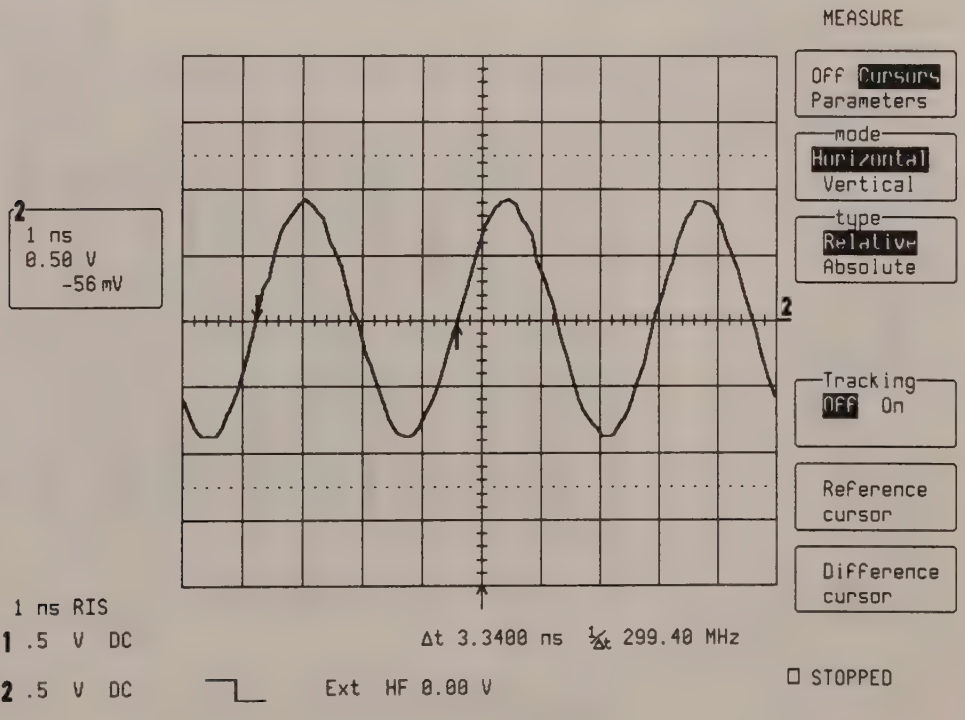
- Turn off all the traces, except Channel 2.
- Display setup : Standard, Persistence off, Single grid
- Trigger setup : Edge
  - Trigger on : Ext
  - Slope line : Positive
  - Mode : Normal
  - Coupling : HF
  - Delay : 50%
  - Level : Zero mV

Set input Ch2 :
- Coupling : 50 Ohm
- Global BWL : Off
- Probe atten : X1
- Gain : .5 V/div
- Offset : Zero mV

Set time base :
- Timebase : 1 nsec/div
- Ris : On

Check:

The scope must keep triggering in a stable way (i.e., a smooth 300 MHz sine wave must be visible on the display).



5.10 Smart Trigger

5.10.1 Trigger on Pulse Width >, <

Set up the DSO :

Turn off all the traces except Channel 1.

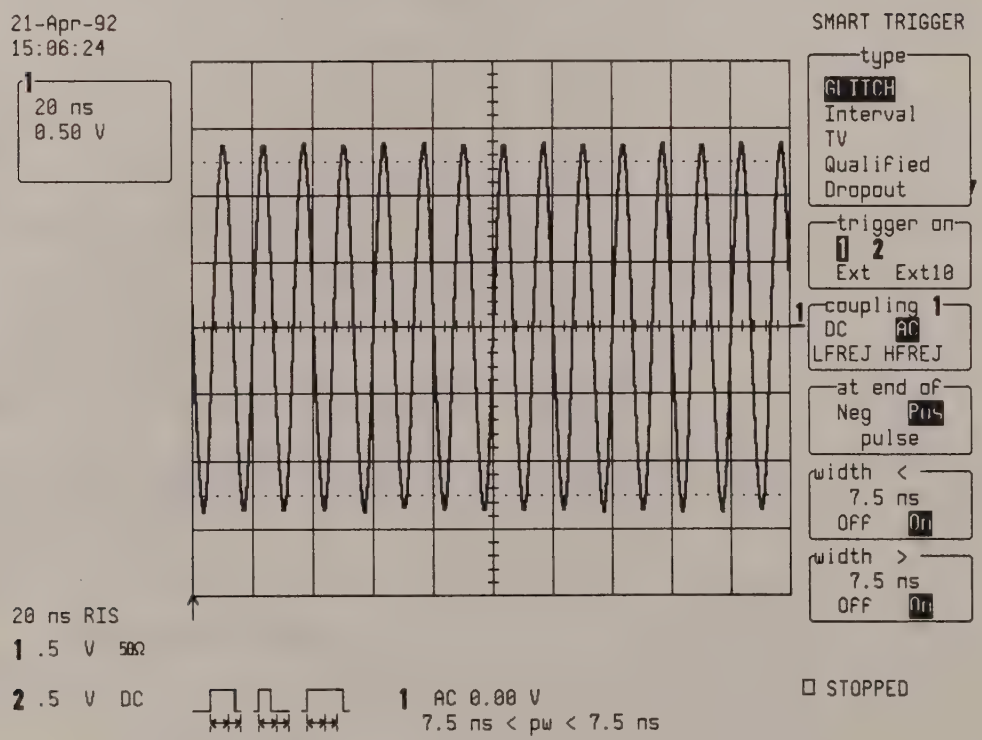
- Trigger setup : Smart
- Setup smart trigger : Glitch
- Trigger on : Channel 1
- Coupling : AC
- at the end of : Positive
- Width < and > : 7.5 ns
- Trigger level : Zero mV
- Trigger delay : Zero % Pretrigger

Set the input of Ch1 :

- Coupling : 50 Ohm
- Gain : .5 V/div
- Offset : Zero mV

Set the time base :

- Time/div : 20 nsec/div
- RIS : On



Apply a sine wave signal of 2.8 V p-p at 75 MHz.
Adjust pulse width to 7.5 nsec for both < and >.

Switch between width < On, and width > On.

Check:

Width < 7.5 nsec, the scope should trigger
Width > 7.5 nsec, the scope should not trigger

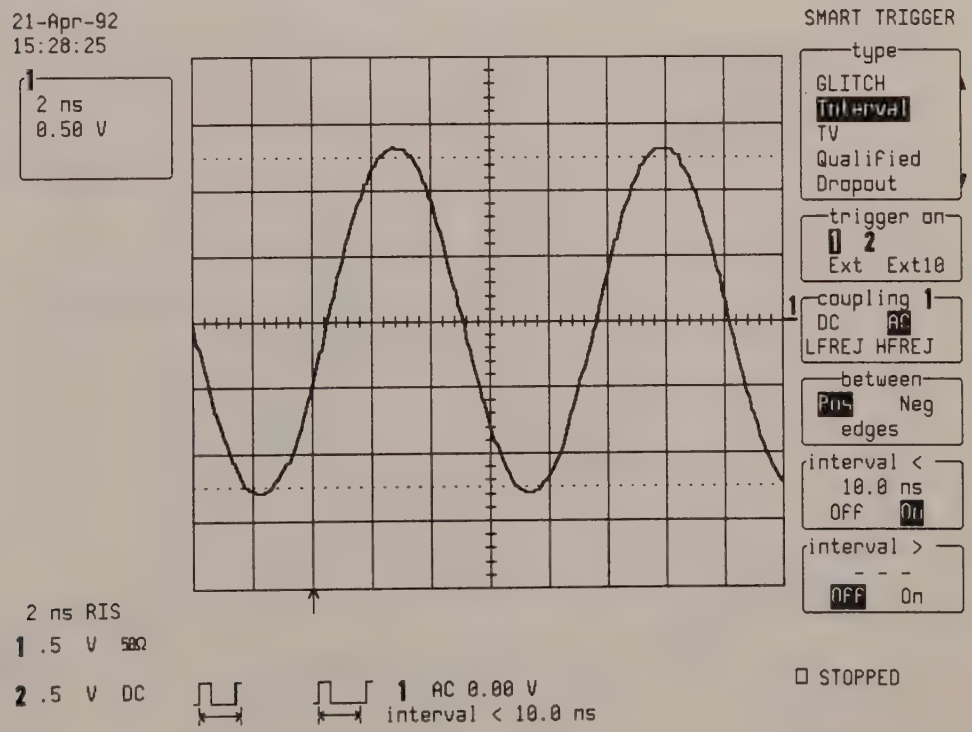
Repeat the above test for Channel 2.

5.10.2 Trigger on Interval Width >, <

Set up the DSO :

Turn off all the traces except Channel 1.

- Trigger setup : Smart
- Setup smart trigger : Interval
- Trigger on : Channel 1
- Coupling : AC
- Between : Positive
- Interval < and > : 10 ns
- Trigger level : Zero mV
- Trigger delay : Zero % Pretrigger



Set the input of Ch1 :

- Coupling : 50 Ohm
- Gain : .5 V/div
- Offset : Zero mV

Set the time base :

- Time/div : 2 nsec/div

Apply a sine wave signal of 2.8 V p-p at 200 MHz to Ch1.

- Turn Interval > : Off
- Turn Interval < : On

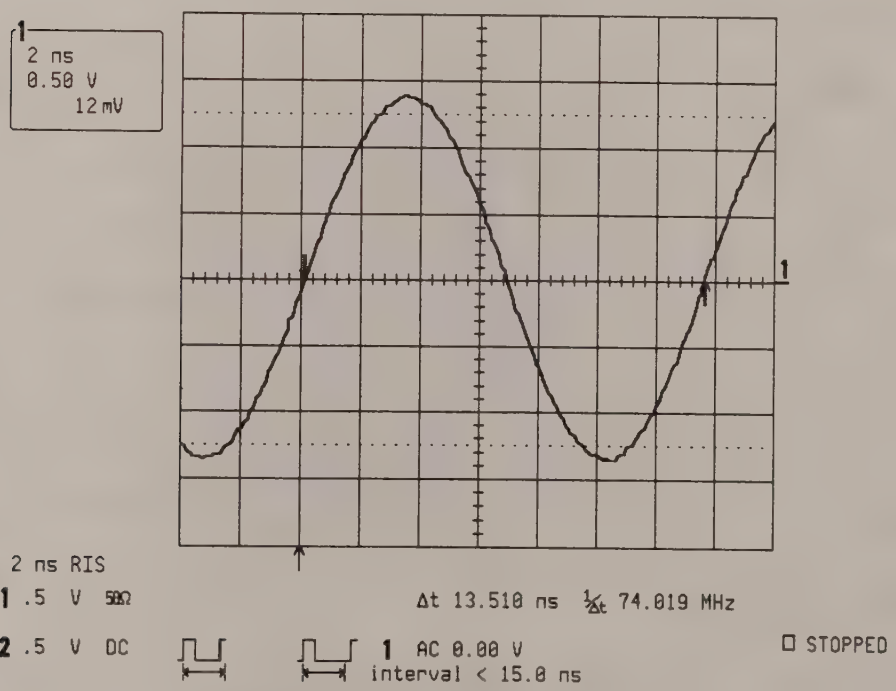
Check:

200 MHz : Interval < 10 nsec, scope should trigger
110 MHz : Interval < 10 nsec, scope should trigger
91 MHz : Interval < 10 nsec, scope should NOT trigger

Set frequency to 74 MHz and interval to < 15 nsec.

Check:

74 MHz : Interval < 15 nsec, scope should trigger
61 MHz : Interval < 15 nsec, scope should NOT trigger



Set up the DSO :

- Trigger setup : Smart
- Setup smart trigger : Interval
- Trigger on : Channel 1
- Coupling : AC
- Between : Positive
- Interval < and > : 25 ns
- Trigger level : Zero mV
- Trigger delay : Zero % Pretrigger

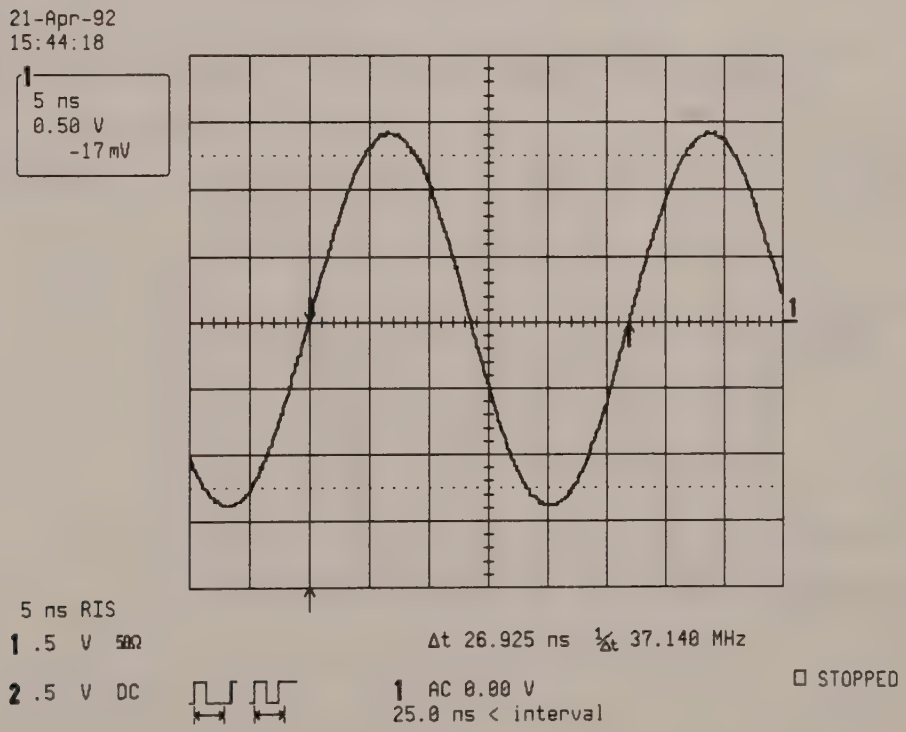
Set the input of Ch1 :
- Coupling : 50 Ohm
- Gain : .5 V/div
- Offset : Zero mV
- Timebase : 5 nsec/div

Apply sine wave signal of 2.8 V p-p at 100 MHz to Ch1.

- Turn interval < : Off
- Turn interval > : On

Check:

100 MHz : Interval > 25 nsec, scope should NOT trigger
44 MHz : Interval > 25 nsec, scope should NOT trigger
37 MHz : Interval > 25 nsec, scope should trigger

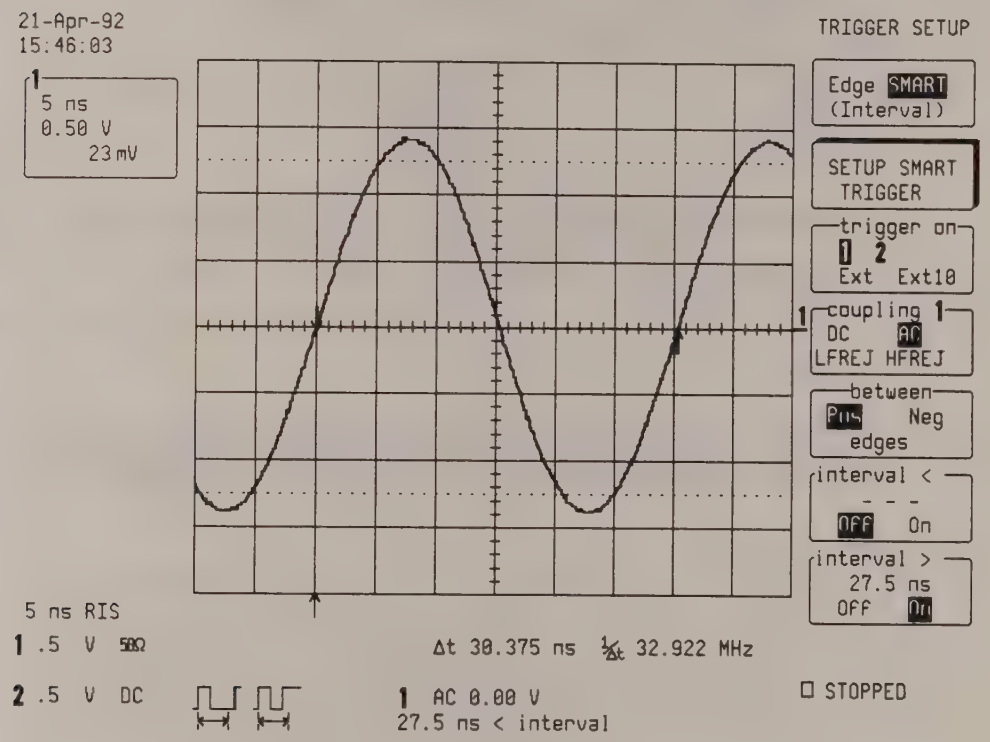


Set the frequency to 40 MHz and interval width to > 27.5 nsec.

Check:

40 MHz : Interval > 27.5 nsec, scope should NOT trigger

33 MHz : Interval > 27.5 nsec, scope should trigger



Repeat all the above tests for Channel 2.

5.11 Time Base Accuracy

5.11.1 Manual Time Base Verification

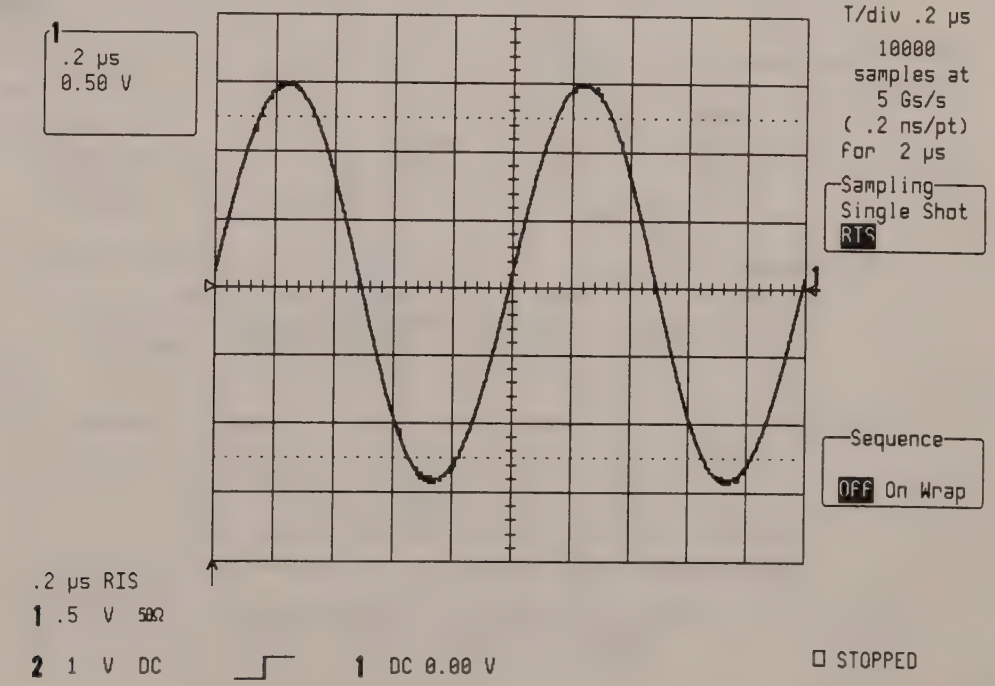
In order to verify the time base, use a sine wave generator of 1 MHz with a frequency accuracy of better than 10 ppm, (for example Marconi 2030).
The following procedure describes a method to check whether the accuracy of the clock is:

100 MHz ± 20 ppm (± 0.002%).

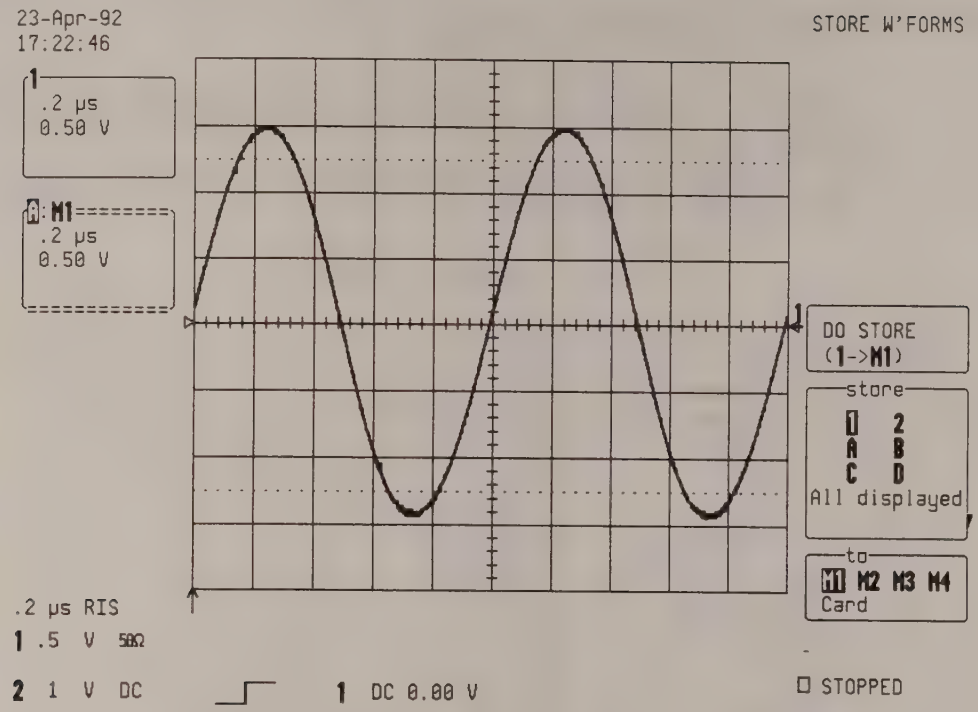
Set up the DSO as follows :

- Trigger setup : Edge
  - Trigger on : Channel 1
  - Slope line : Positive
  - Coupl : DC
  - Mode : Norm
  - Delay : 0% Pretrigger
  - Level : Zero mv
- Turn on trace : Channel 1
- Coupling : 50 Ohm
- Global BWL : Off
- Probe atten : X1
- Gain : .5 V/div
- Offset : Zero mV
- Timebase : .2 µsec/div
- RIS : On

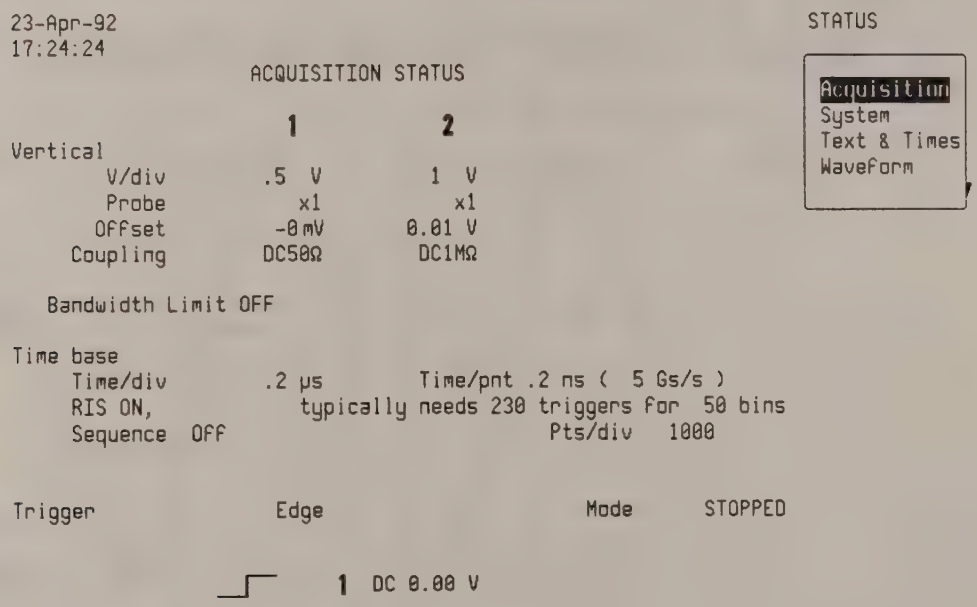
Set the sine wave generator to 1 MHz and apply a signal to Ch1. Adjust amplitude to get about a 6 divisions peak to peak display.



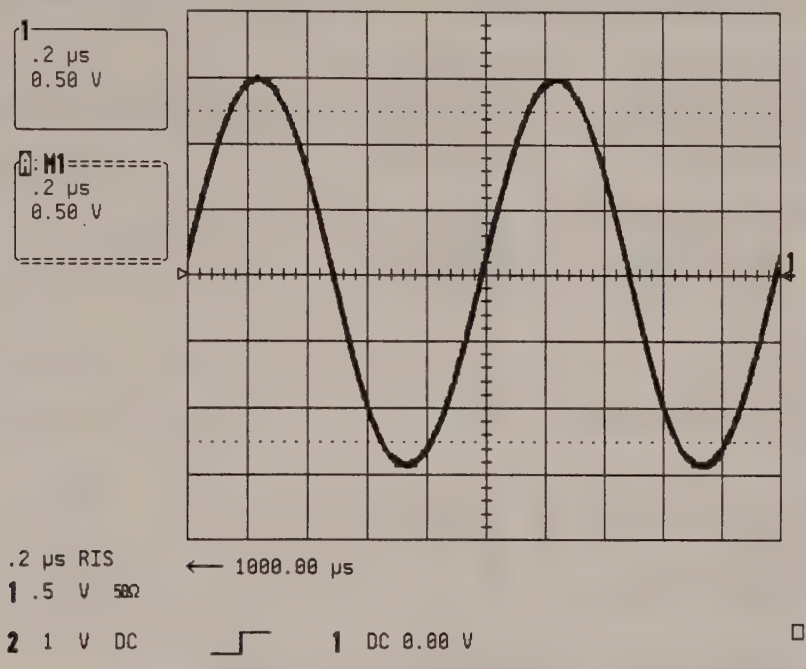
Store Channel 1 in memory 1.



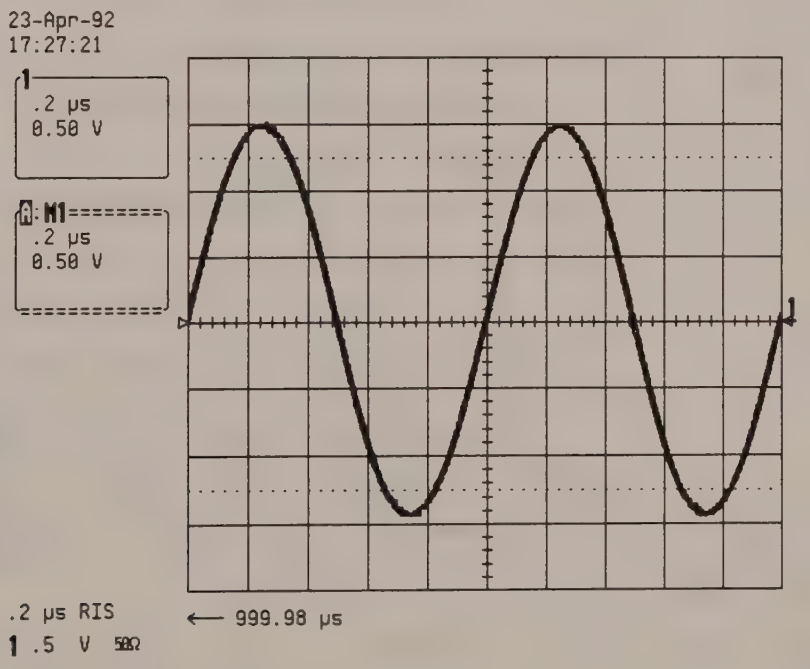
Set post-trigger delay to 1000.00 µs. This allows the accuracy of the time base clock to be checked 1000 periods after the trigger point.



Check that the displayed Channel 1 trace is aligned with the sine wave from memory 1.



A difference of ± 0.02 µs corresponds to ± 20 ppm.
See figure below



5.12 Overshoot Verification

Set up the DSO as follows :

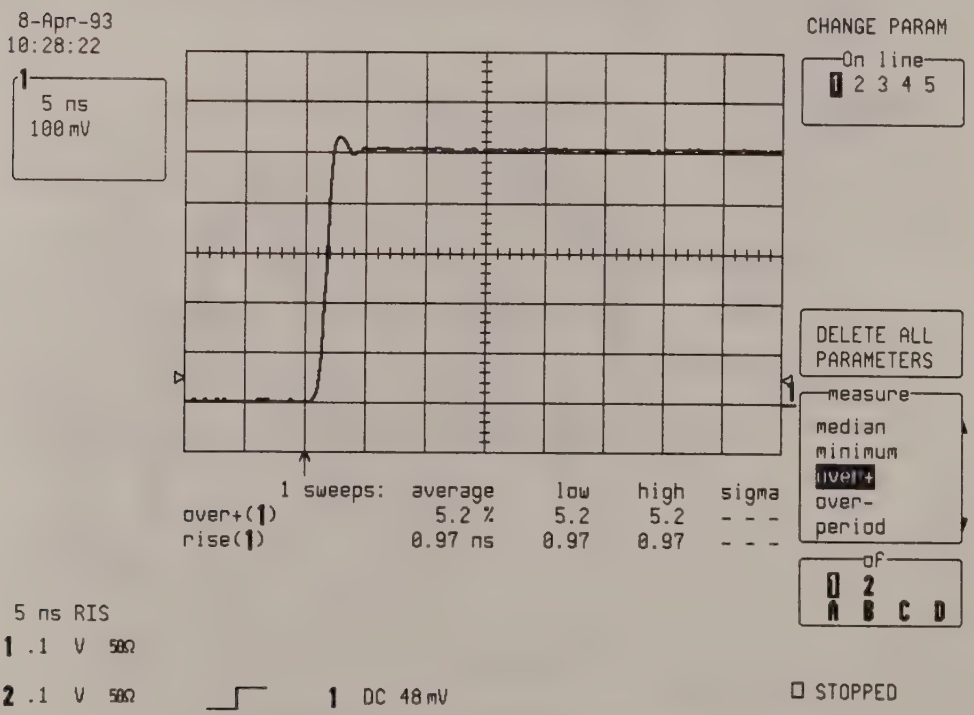
- Turn on trace : Channel 1
- Display setup : Standard, Persistence off, Single grid
- Input coupling : 50 Ohm DC
- Input gain : 100 mV/div.

- Trigger setup : Edge
  - Trigger on : Channel 1
  - Slope line : Positive
  - Mode : Norm

- Timebase : 5 ns/div
- Global BWL : Off
- Probe attenuator : X1

- Cursors/Measure : Parameters
- Mode : Custom
- Statistics : On
- Change Parameters :

  On line 1 : Measure over+ of Ch1
  On line 2 : Measure rise of Ch1



Apply the fast pulse generator LeCroy 4969 (< 700 ps) to Channel 1

Set the pulser to 61.05 µs

Check :

Overshoot must be 5% +/- 1%

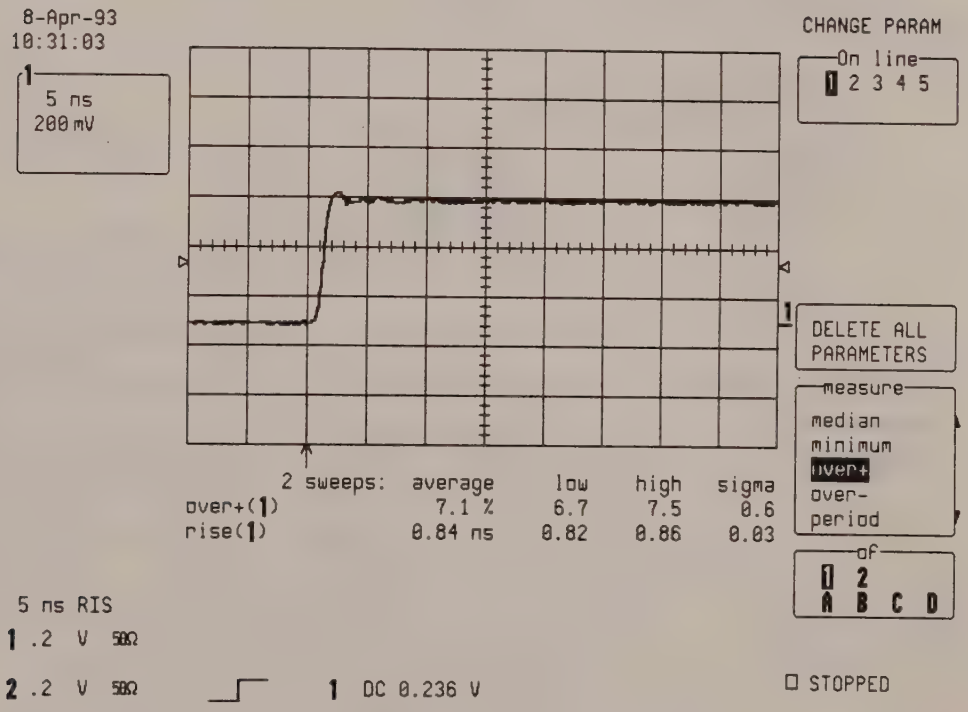
Risetime must be < 1.1 ns

- Select input gain : 200 mV/div

Check :

Overshoot is typically < 10%

Risetime < 1.1 ns



Repeat overshoot and risetime tests for Channel 2.

5.13 Probe Calibrator verification

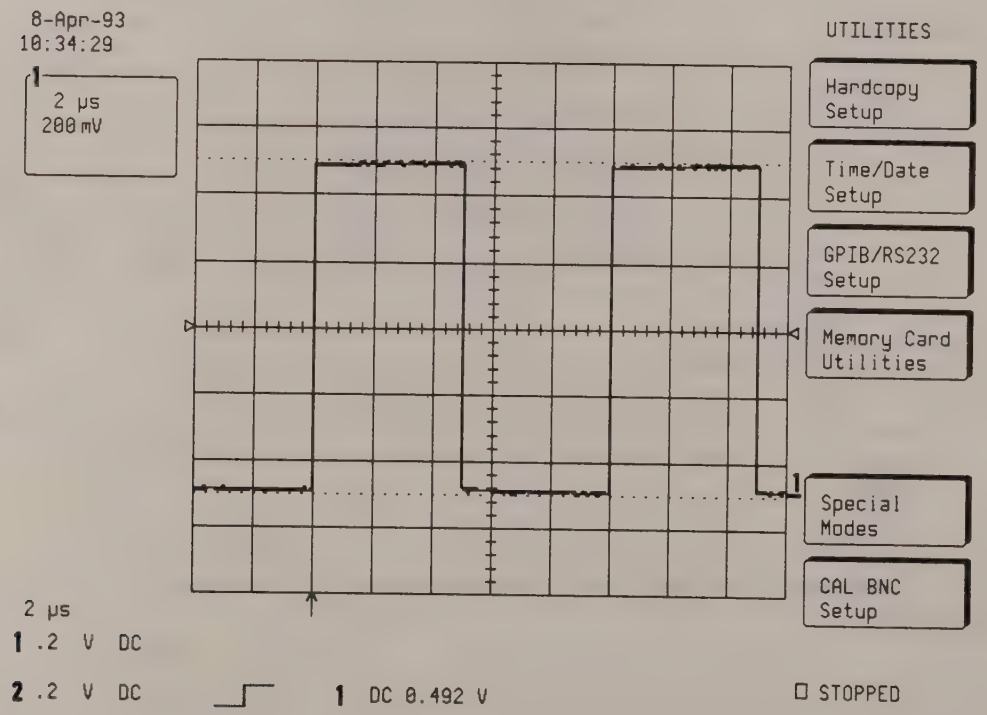
Set up the DSO as follows :

- Turn on trace : Channel 1
- Display setup : Standard, Persistence off, Single grid
- Input coupling : 1 MOhm, DC
- Input gain : 200 mV/div.

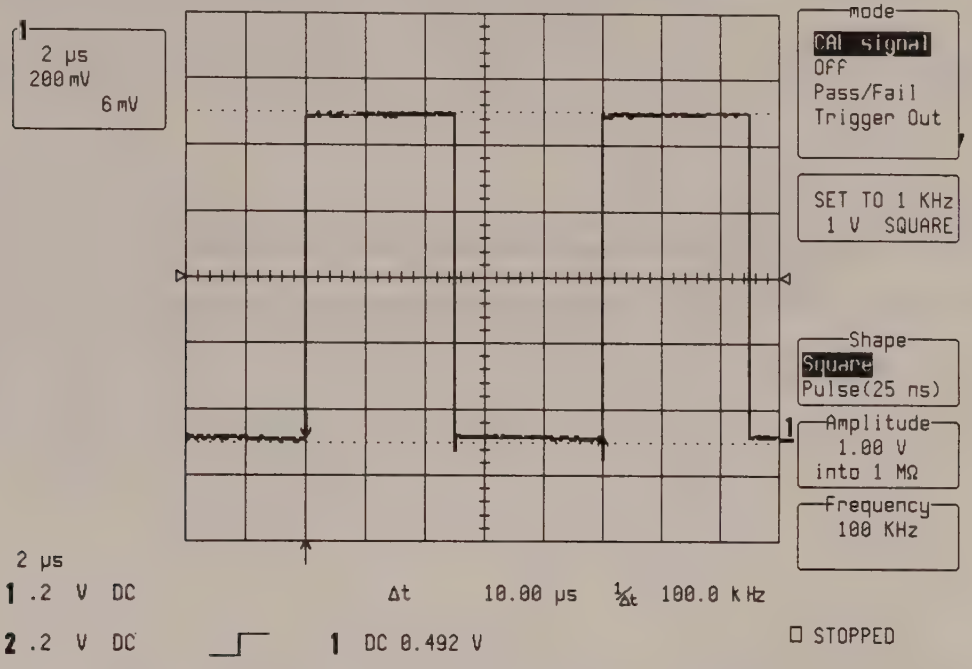
- Trigger setup : Edge
  - Trigger on : Channel 1
  - Slope line : Positive
  - Mode : Norm or Auto
  - Level : Zero mV
  - Delay : 10 %

- Timebase : 2 µs/div
- Global BWL : Off
- Probe attenuator : X1

- Select utilities
- Select Cal BNC setup
- Cal BNC out mode : Cal signal
- Shape : Square
- Amplitude : 1.00 V into 1 MOhm
- Frequency : 100 KHz



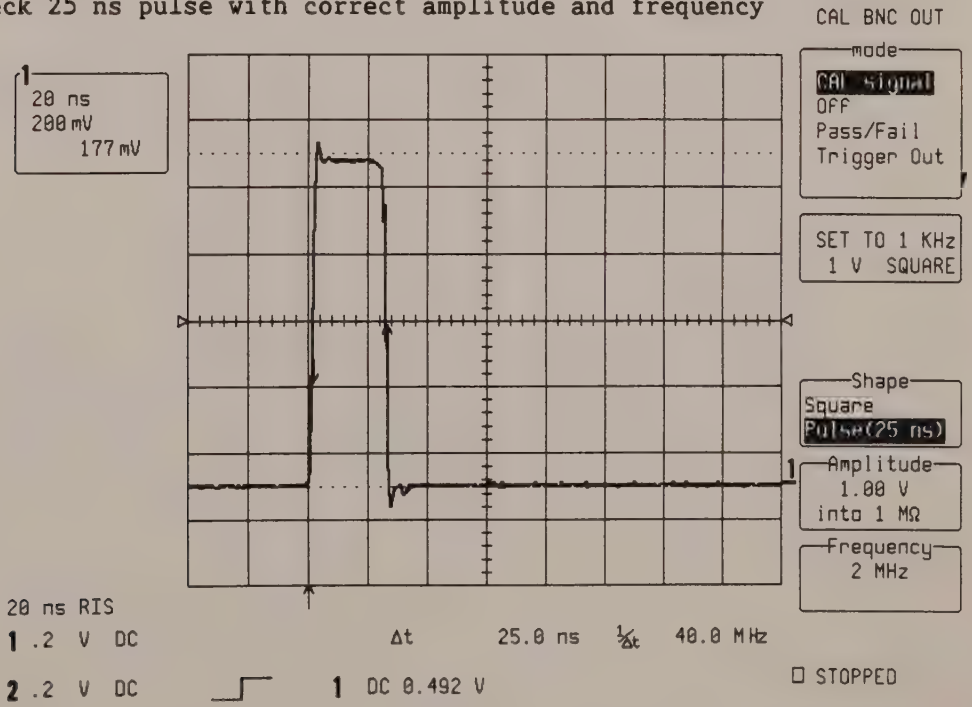
Connect Cal BNC out to Channel 1.
Check Square signal with correct amplitude and frequency (+/- 5%).



Check frequency range from 500 Hz to 2 MHz
Check amplitude range from .05 V to 1V

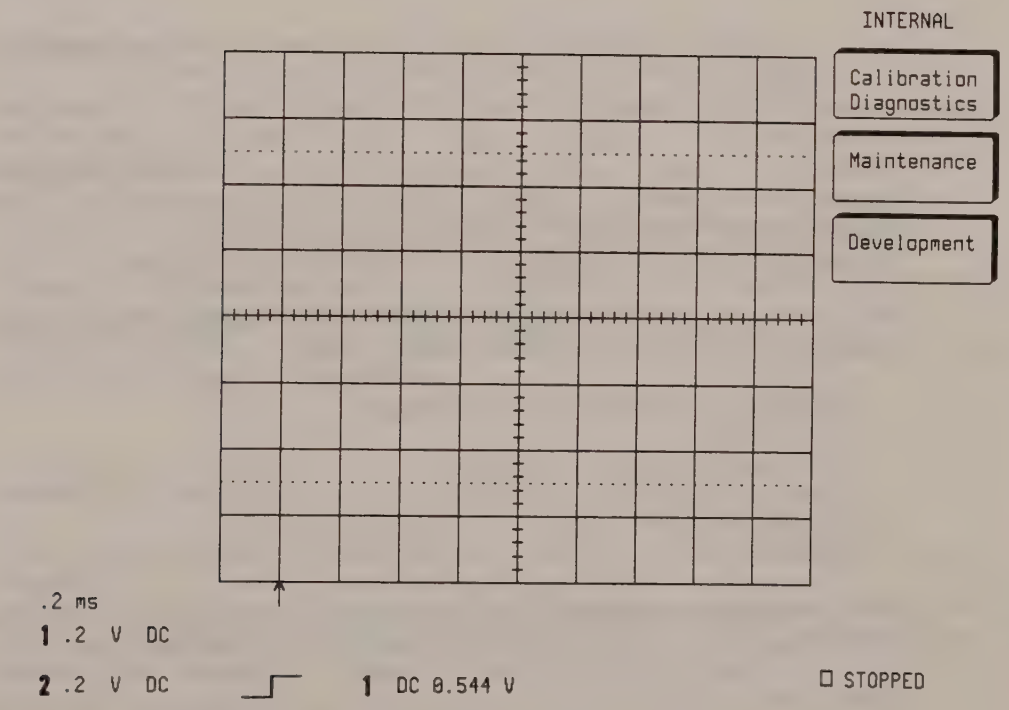
- Select Shape : Pulse (25 ns)
- Timebase : 20 ns/div

Check 25 ns pulse with correct amplitude and frequency

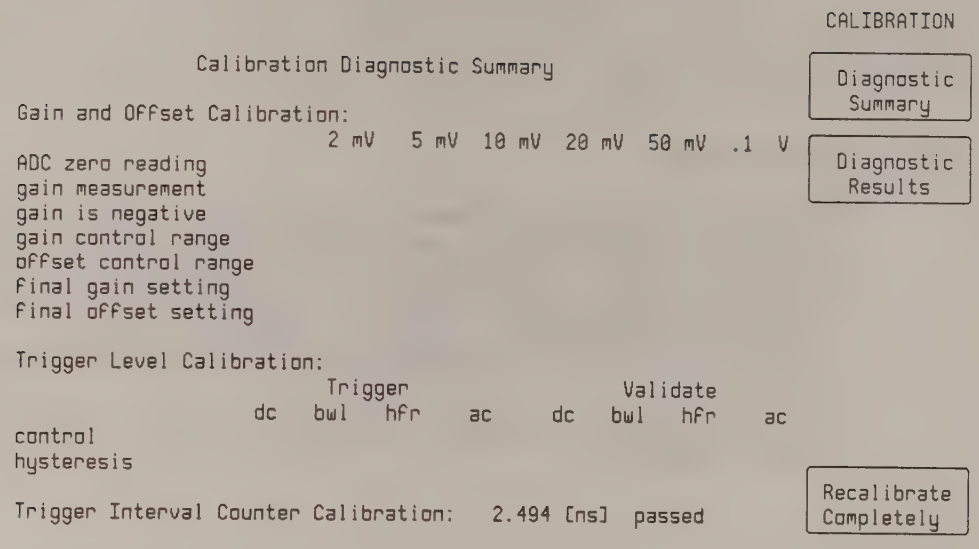


6.1 Introduction

The 9310 internal calibration and diagnostics menu is entered by simultaneously depressing the third and fourth menu push buttons on the right hand side of the CRT and then by depressing the fifth.
To quickly check the performance of the 9310 oscilloscope, select the calibration diagnostics, and press diagnostic summary.
Press the calibrate completely button to do a full recalibration of the front end.
It is advisable to perform this type of check when the scope is in a stable condition.



6.2 Diagnostic Summary



This is a handy tool to perform a quick but comprehensive internal performance check, without touching the acquisition settings. The failures are indicated by channel identifiers.
If no problem is detected, the fields are left blank.

The gain and offset results displayed for Channel 1 and Channel 2 are independent of the following conditions:

- 50 Ohm or 1 MOhm input impedance
- Time base
- Trigger mode and coupling
- BWL on or off
- Variable gain
- Offset

The internal calibration is checked at 1 MOhm, DC and for the six gain settings : 2 mV, 5 mV, 10 mV, 20 mV, 50 mV, 100 mV.

The five ranges 0.2 V, 0.5 V, 1 V, 2 V, 5 V are not calibrated.
The 50 Ohm input is not verified by the calibration.

6.3 Gain and Offset Calibration Description

ADC zero reading : For this test the DAC offset is set to zero. The variable calibration signal is changed until the ADC reads zero.

Gain measurement : The value of the variable gain is measured.

Gain negative : An error is displayed if negative gain is found.

Gain control range : This test verifies the range of the variable gain.

Offset control range : The range of the variable offset is checked.

Final gain setting : The variable gain and fixe gain is changed. The measurement is verified.

Final offset setting : Not yet implemented.

6.4 Trigger Level Calibration

The control of the trigger hysteresis is done in the trigger mode: DC, BWL on, HFr, AC, for the two trigger sections: trigger level and validate level.

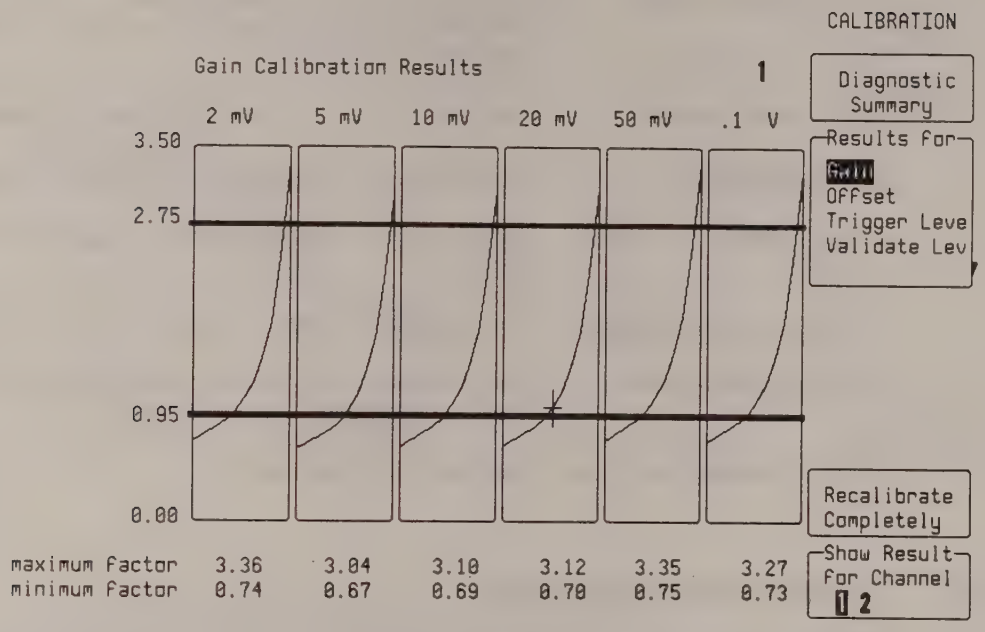
If an error occurred 1, 2 or E is displayed corresponding to Channel 1, Channel 2 or External trigger.
Trigger level corresponds to the MTR408 in LOC A5002, and validate level corresponds to the MTR408 in Loc A5001.
Trigger interval counter calibration must be passed if no trigger calibration error is detected.

6.5 Diagnostic Results

This menu displays the gain curves, offset curves of Channel 1, and Channel 2.
The tests allows the user to check whether the dynamic range of the programmable input amplifiers is sufficient, The trigger level is checked for Channel 1, Channel 2 and External trigger.

6.6 Gain Curves

Select Results for gain, and show result for Channel 1.



X = DAC range , from -10 V to +7.5 V

Y = Inverse of the gain

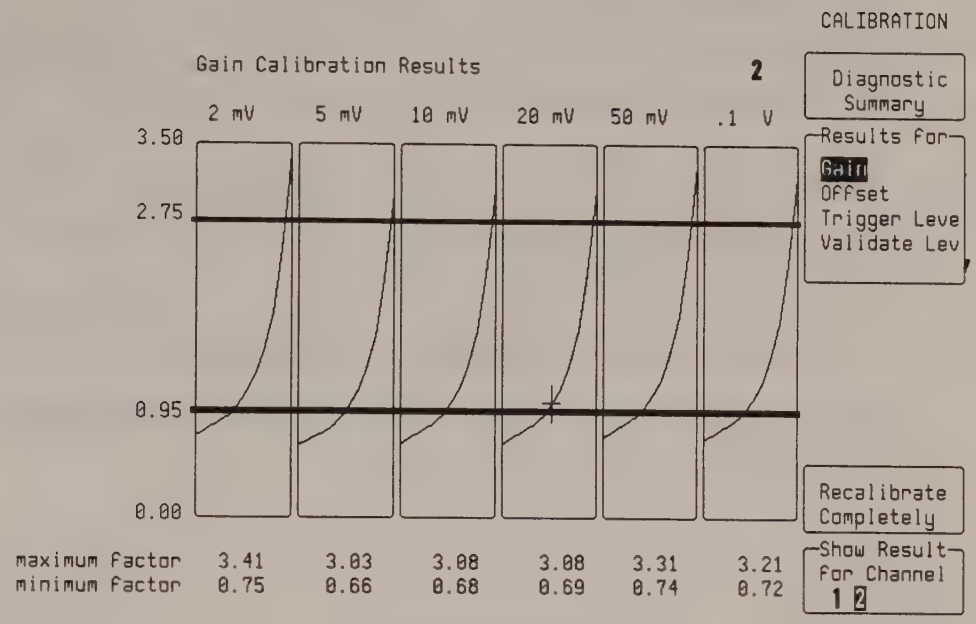
Variable gain range, checked by software must be better than 0.95 to at least 2.75 for the six displayed sensitivities.

With regard to the illustration, the lower portion of the curve must extend below the 0.95 limit, and the upper portion above the 2.75 limit.

The maximum and minimum factor is displayed for each range.

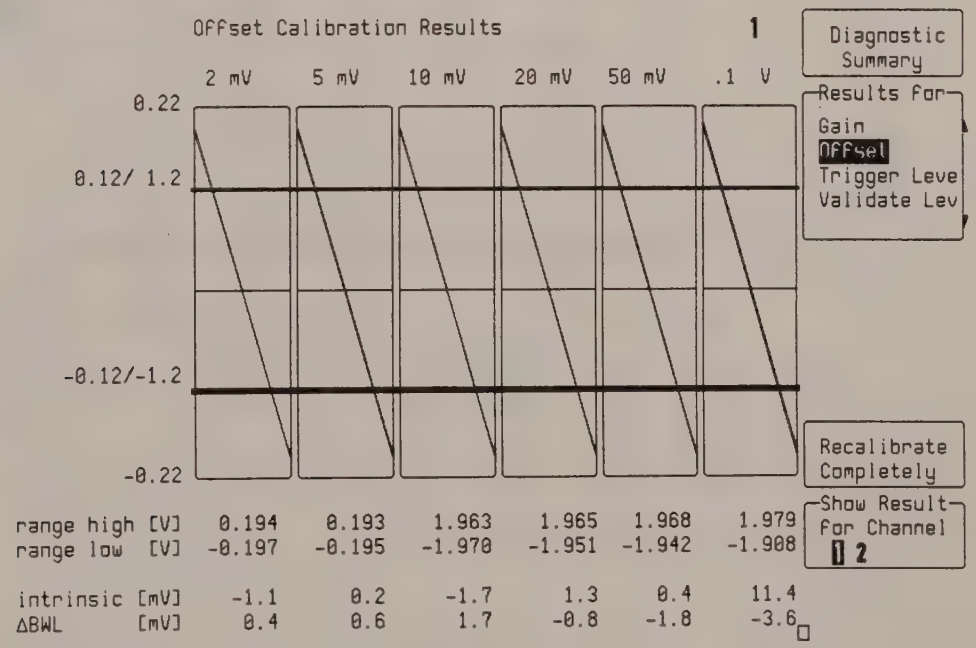
See front end calibration procedure for the variable gain adjustment.

Repeat the test for Channel 2.



6.7 Offset Curves

Select results for offset, and show result for Channel 1.



X = Offset DAC range, Y = Offset

The curves should be above the positive limits 0.12 V / 1.2 V and below the negative limits -0.12 V / -1.2 V.

For the sensitivities : 2 mV /div, 5 mV/div, a 1/10 attenuator is used, the limits are ± 0.12 V.

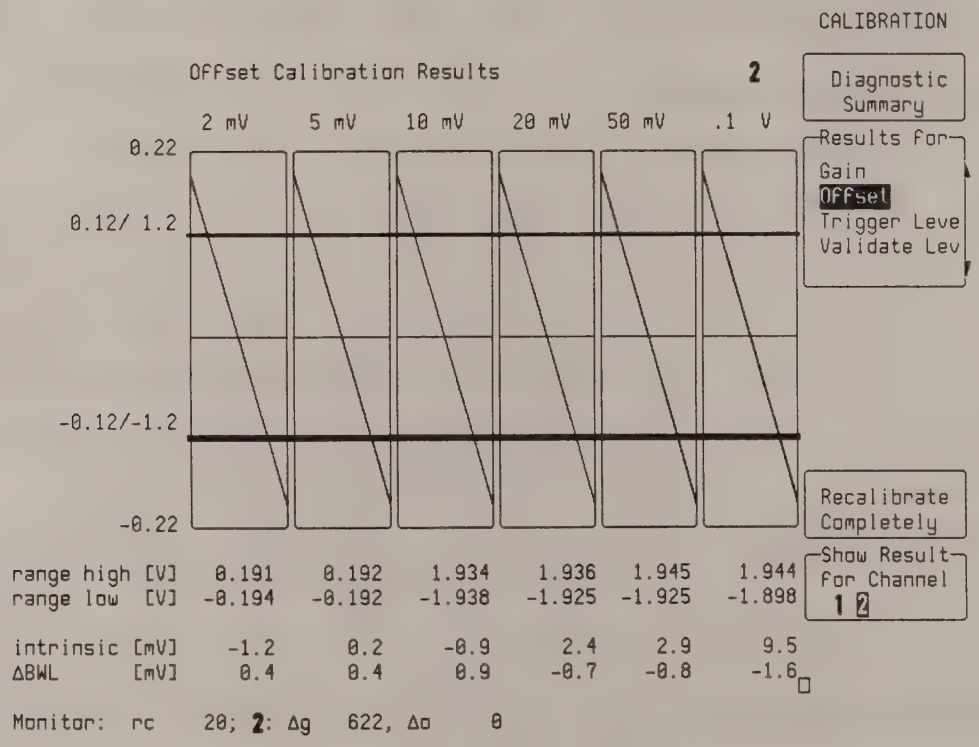
For the sensitivities 10 mV, 20 mV, 50 mV, 0.1 V/div, the limits are ± 1.2 V.

The maximum and minimum offset is ± 1.2 V. The calibration verifies that the DAC can reach this value.

The intrinsic value represents the offset in mV that should be applied to get zero offset to the ADC.

NB : Delta BWL is the difference between BWL on and BWL off.

Repeat the offset test for Channel 2.



6.8 Trigger Calibration

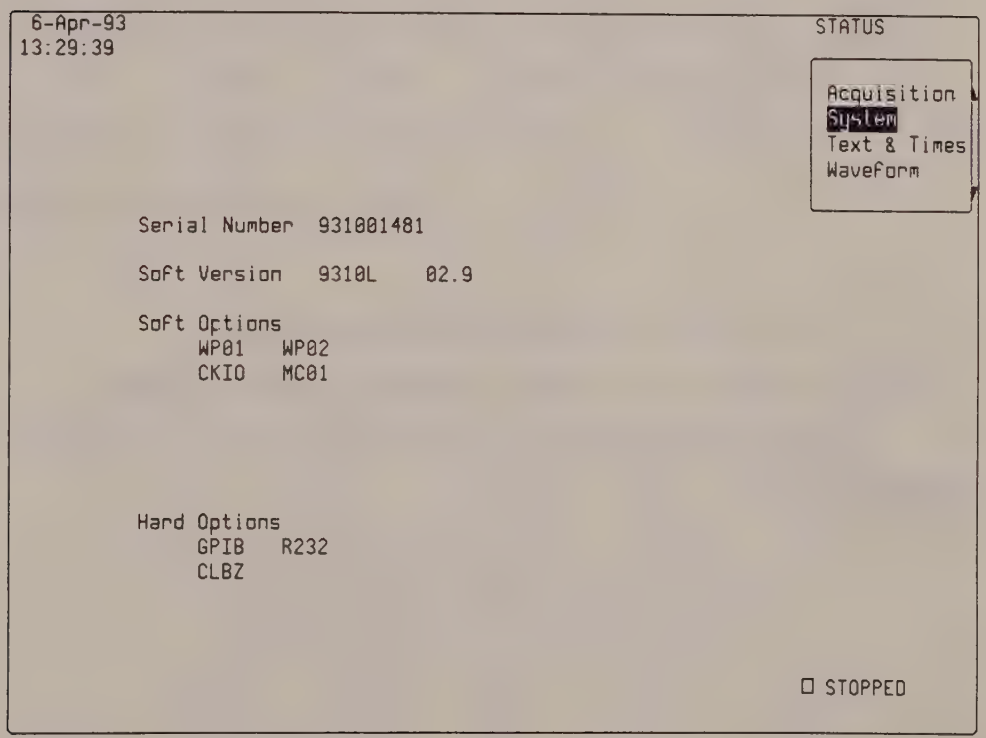
For Channel 1 and Channel 2 the trigger range is ± 5 divisions.
The hysteresis value is given in divisions. The positive and negative slope are displayed.
The difference between the two slopes represents the trigger hysteresis.

A zoom of the positive or negative hysteresis is displayed, the scale is ± 1 division. For the external trigger the hysteresis is in volt.

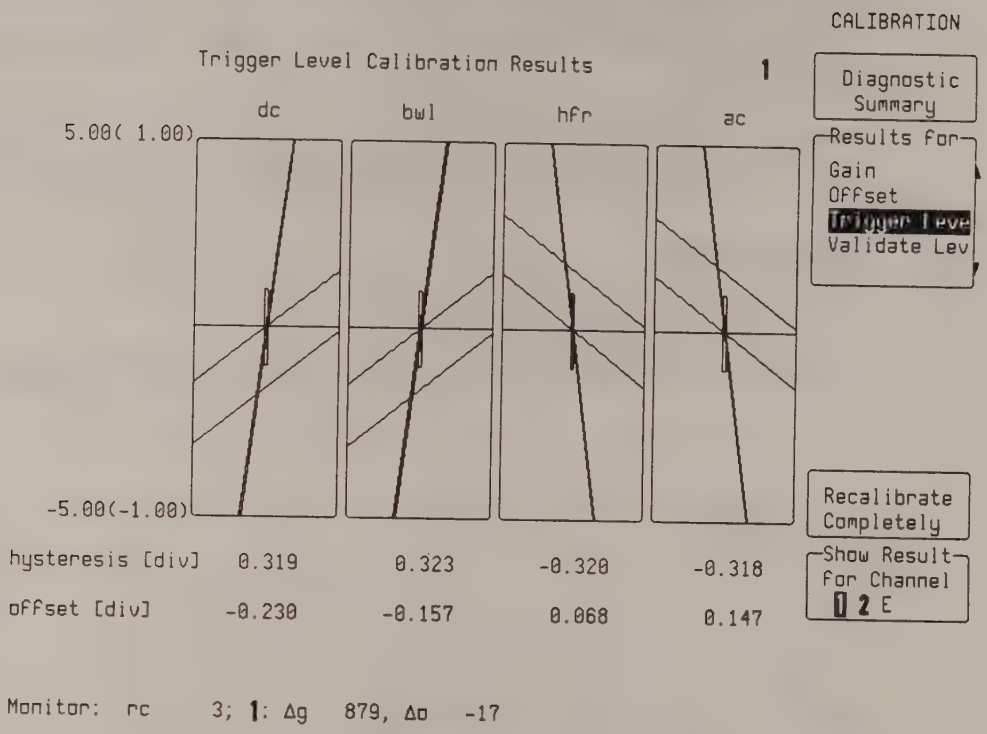
6.9 Trigger Level

6.9.1 9310/M/L with CLBZ hardware option

For F9310/M/L-3 base board revision F and G with CLBZ hard option



Select trigger level and show result for Channel 1.

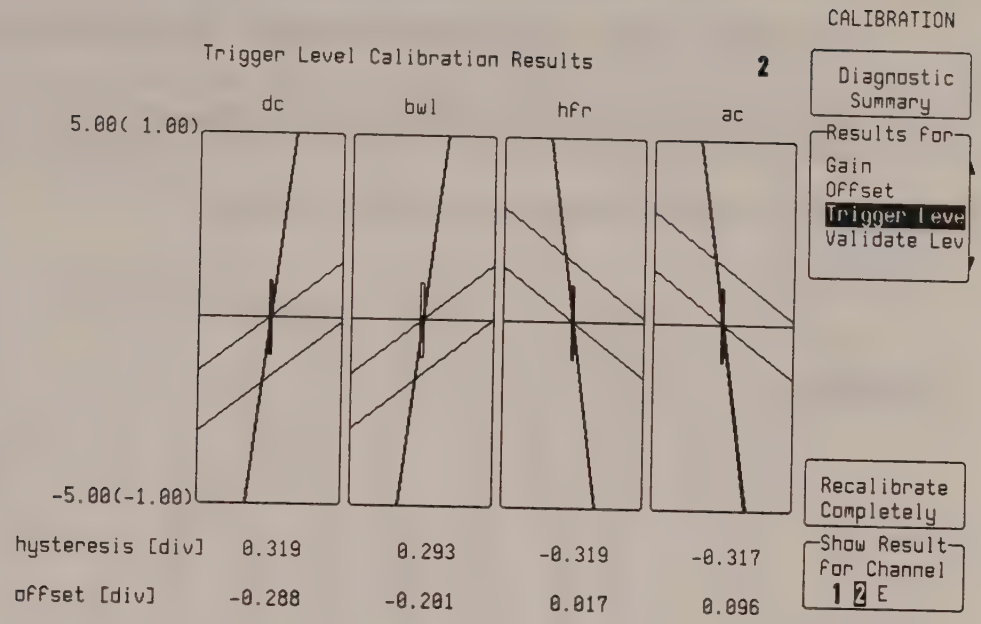


The hysteresis should be 0.35 div ± 0.05 div.

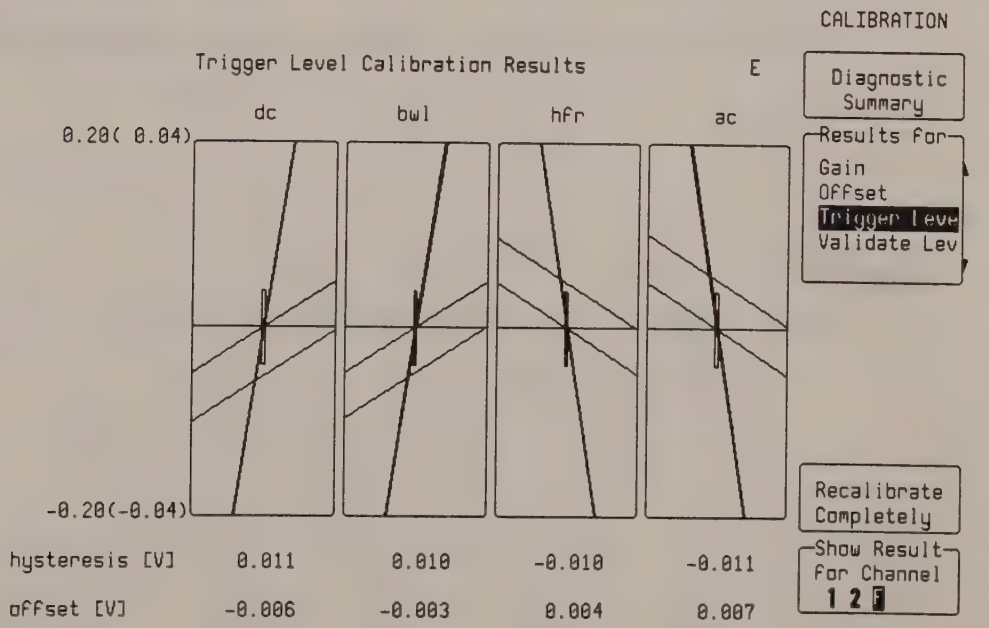
The offset of the positive slope is also mentioned.

The trigger adjustment is described in the front end calibration procedure, section 7.6.2.

Repeat the test for Channel 2.



Select show result for external.



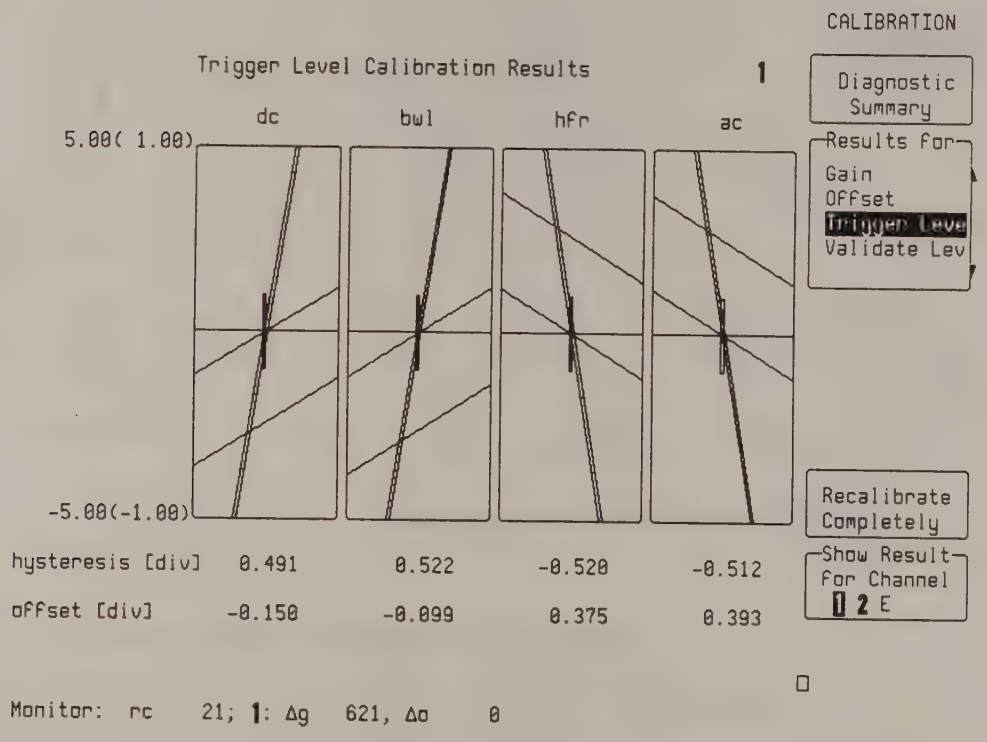
The hysteresis in volt should be 0.012 V ± 0.002 V.

6.9.2 9310/M/L with standard hardware option

For 9310/M/L DSO's with standard hardware option, F9310/M/L-3 base board revision C and D

Select trigger level and show result for Channel 1, then repeat the test for Channel 2.

the hysteresis should be 0.5 div ± 0.1 div



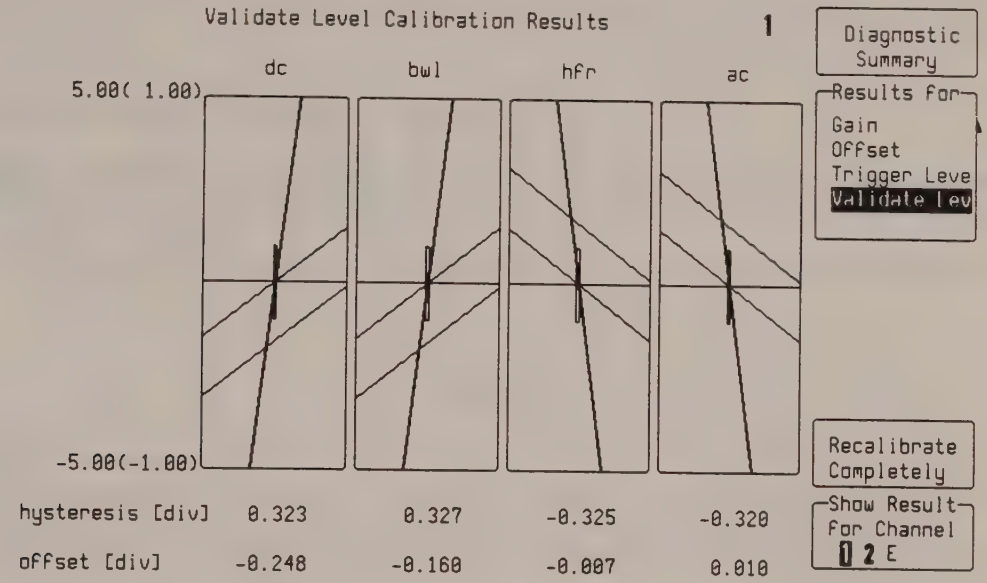
Select show result for external trigger.

The hysteresis in volt should be 0.02 V ± 0.005 V.

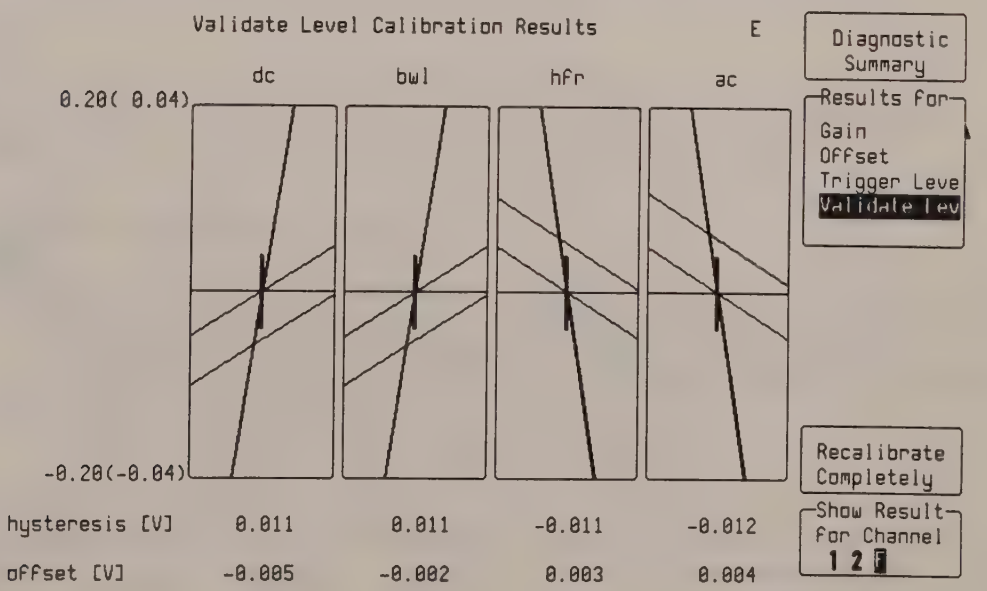
6.10 Validate Level

6.10.1 9310/M/L with CLBZ hardware option

For F9310/M/L-3 base board revision F and G with CLBZ hardware option the hysteresis in divisions should be 0.35 div ± 0.05 div.
Select validate level and show result for Channel 1, then repeat the test for Channel 2.

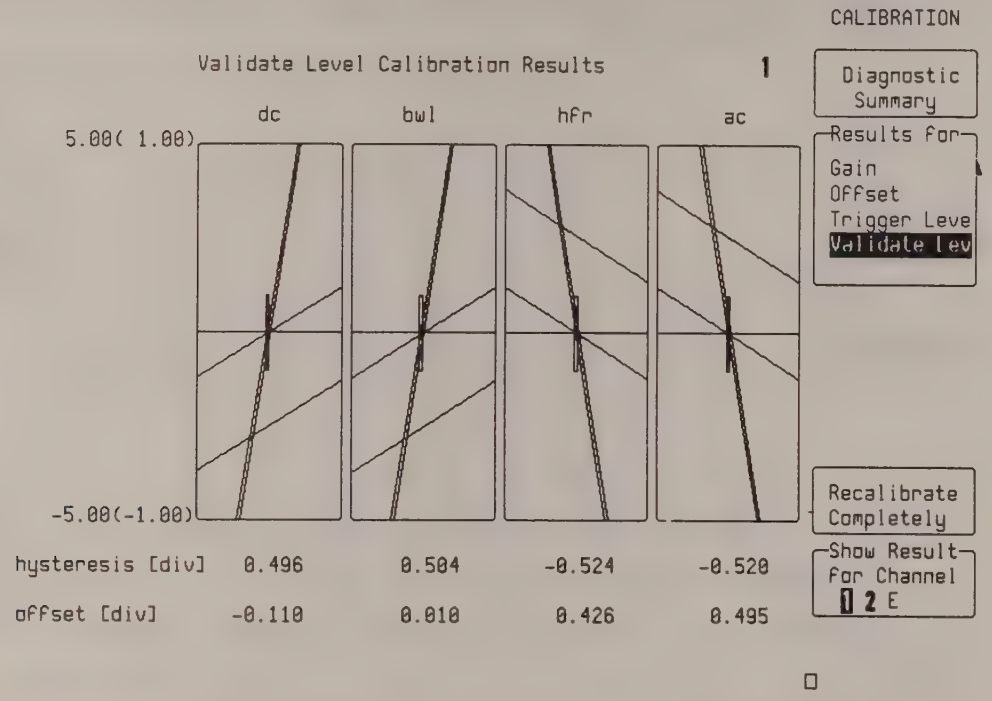


Select show result for external : hysteresis should be 0.012 V ± 0.002

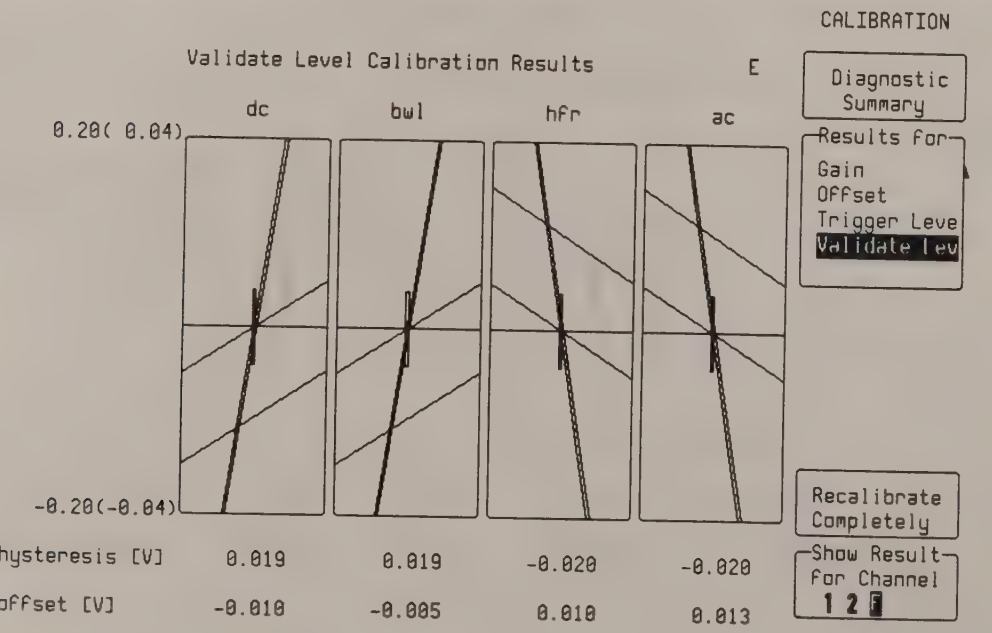


6.10.2 9310/M/L with standard hardware option

For F9310/M/L-3 base board revision C and D with standard hard option the hysteresis in divisions should be 0.50 div ± 0.1 div.
Select validate level and show result for Channel 1, then repeat the test for Channel 2.



Select show result for external : hysteresis should be 0.02 V ± 0.005



SECTION 7 MAINTENANCE

7.1 Introduction

This section contains information necessary to disassemble, assemble maintain, calibrate and troubleshoot the LeCroy 9310/M/L oscilloscope.

7.2 Disassembly and Assembly Procedure

The disassembly and assembly procedures detailed below refer to the assembly and disassembly diagram 7.2.1, and the view of figures 7.1, 7.2, 7.3 and 7.4.
Please study the diagram and figures before attempting disassembly.

WARNING

Before removing any parts from the LeCroy 9310/M/L be sure to read carefully the instructions referring to those parts, noting any precautions needed to avoid problems caused by mechanical behavior, high voltage supplies, etc.

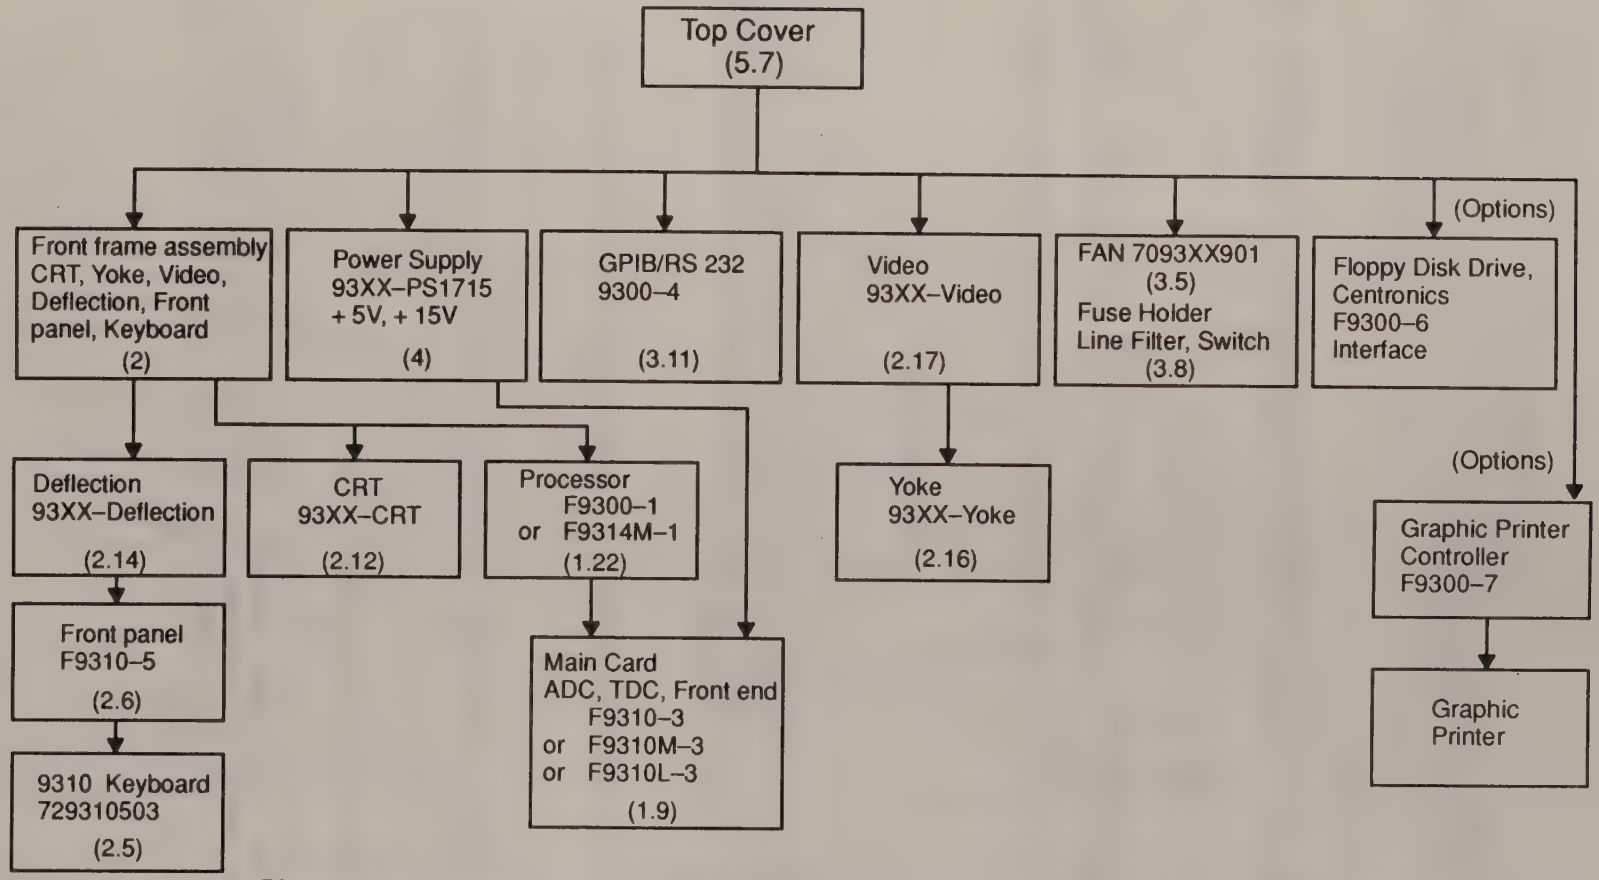
CAUTION

The usual precautions against static electricity are required, (see 1.10)

7.2.2 Removal of the Upper Cover (5.7)

The top cover (5.7) is secured by two M4x5 screws (5.9) on both sides of the front panel assembly (2), and by two M4x8 screws (5.8) on the rear panel (3). Remove the screws and carefully slide the cover off the unit to the rear. Removal of the top cover gives access to the boards and parts listed in section 7.2.1.

7.2.1 Disassembly and Assembly Diagram



Disassembly: If it becomes necessary to replace a board or a part, use the disassembly diagram to disassemble the unit. Any board can be removed only if any items higher in the diagram and connected by a line are already out.

Assembly: Reassemble the unit in the reverse order.

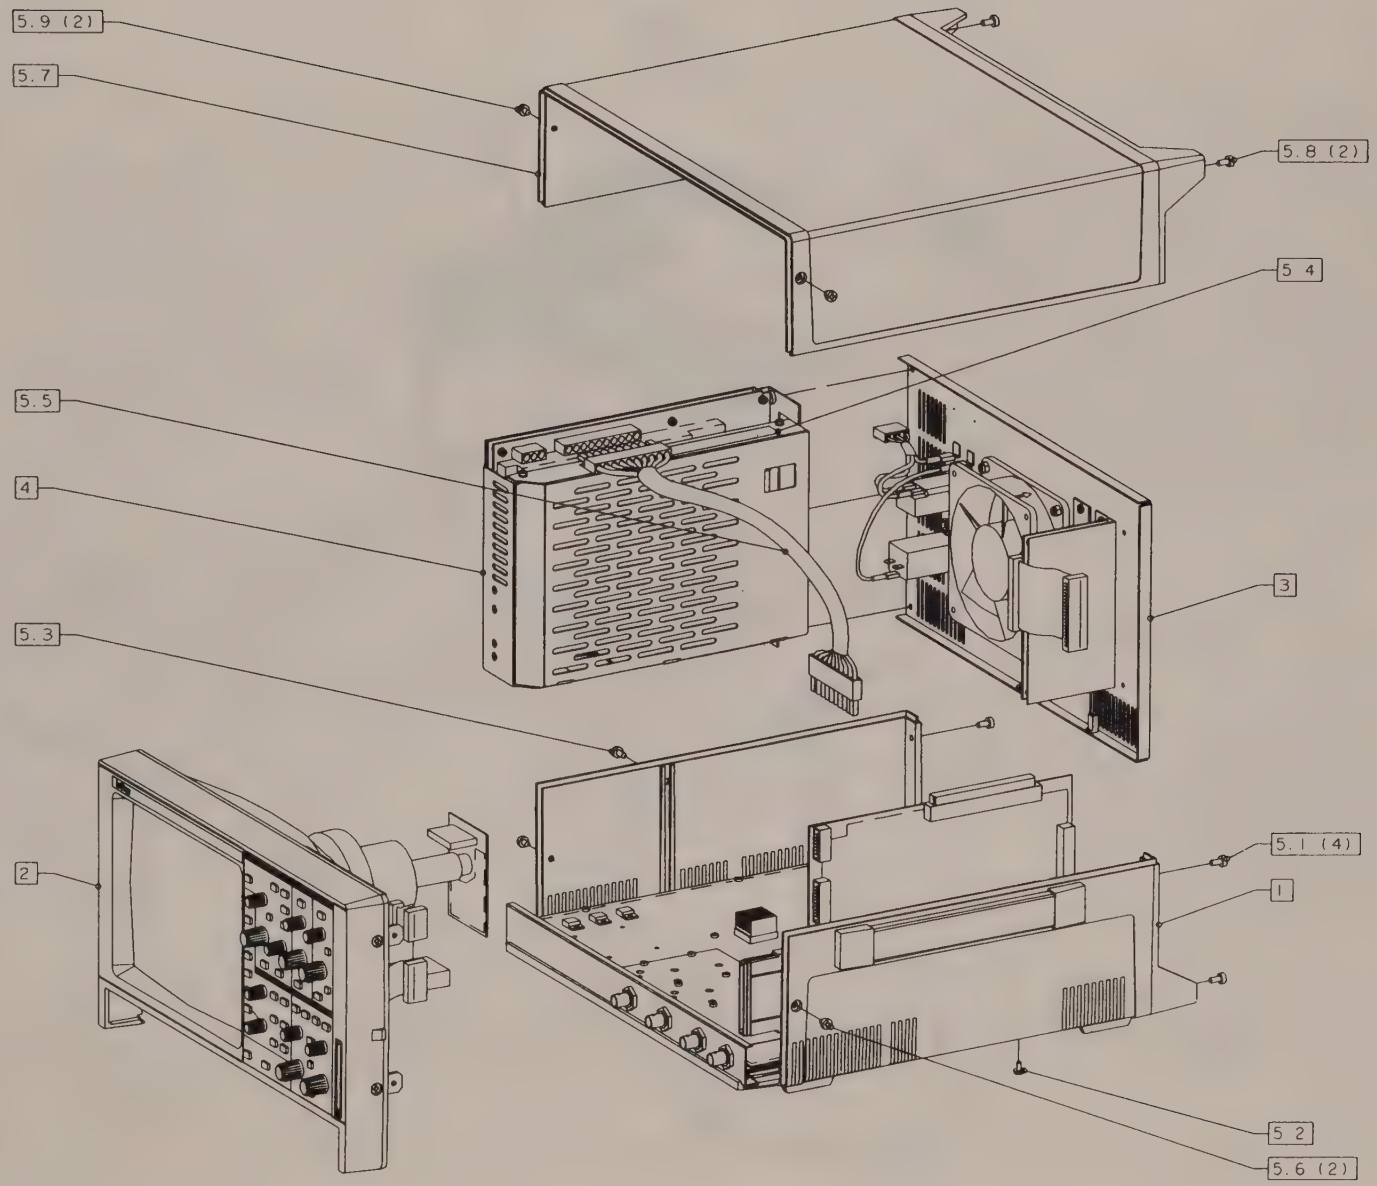


FIGURE 7.1: 9310 DSO EXPLODED VIEW

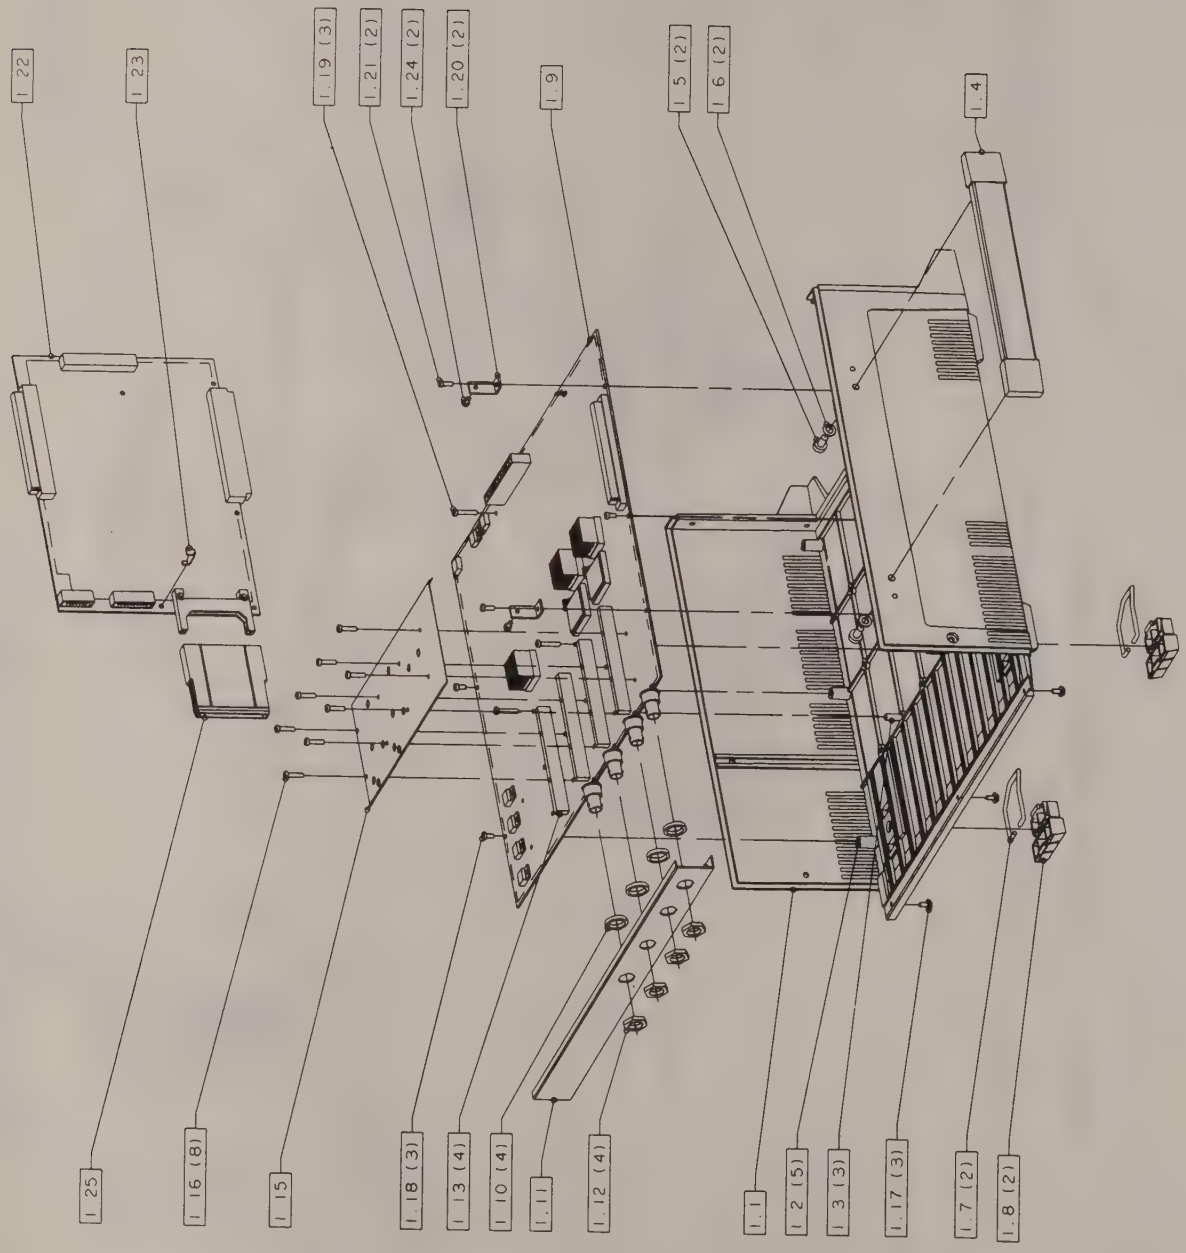

FIGURE 7.2: 9310 LOWER COVER EXPLODED VIEW

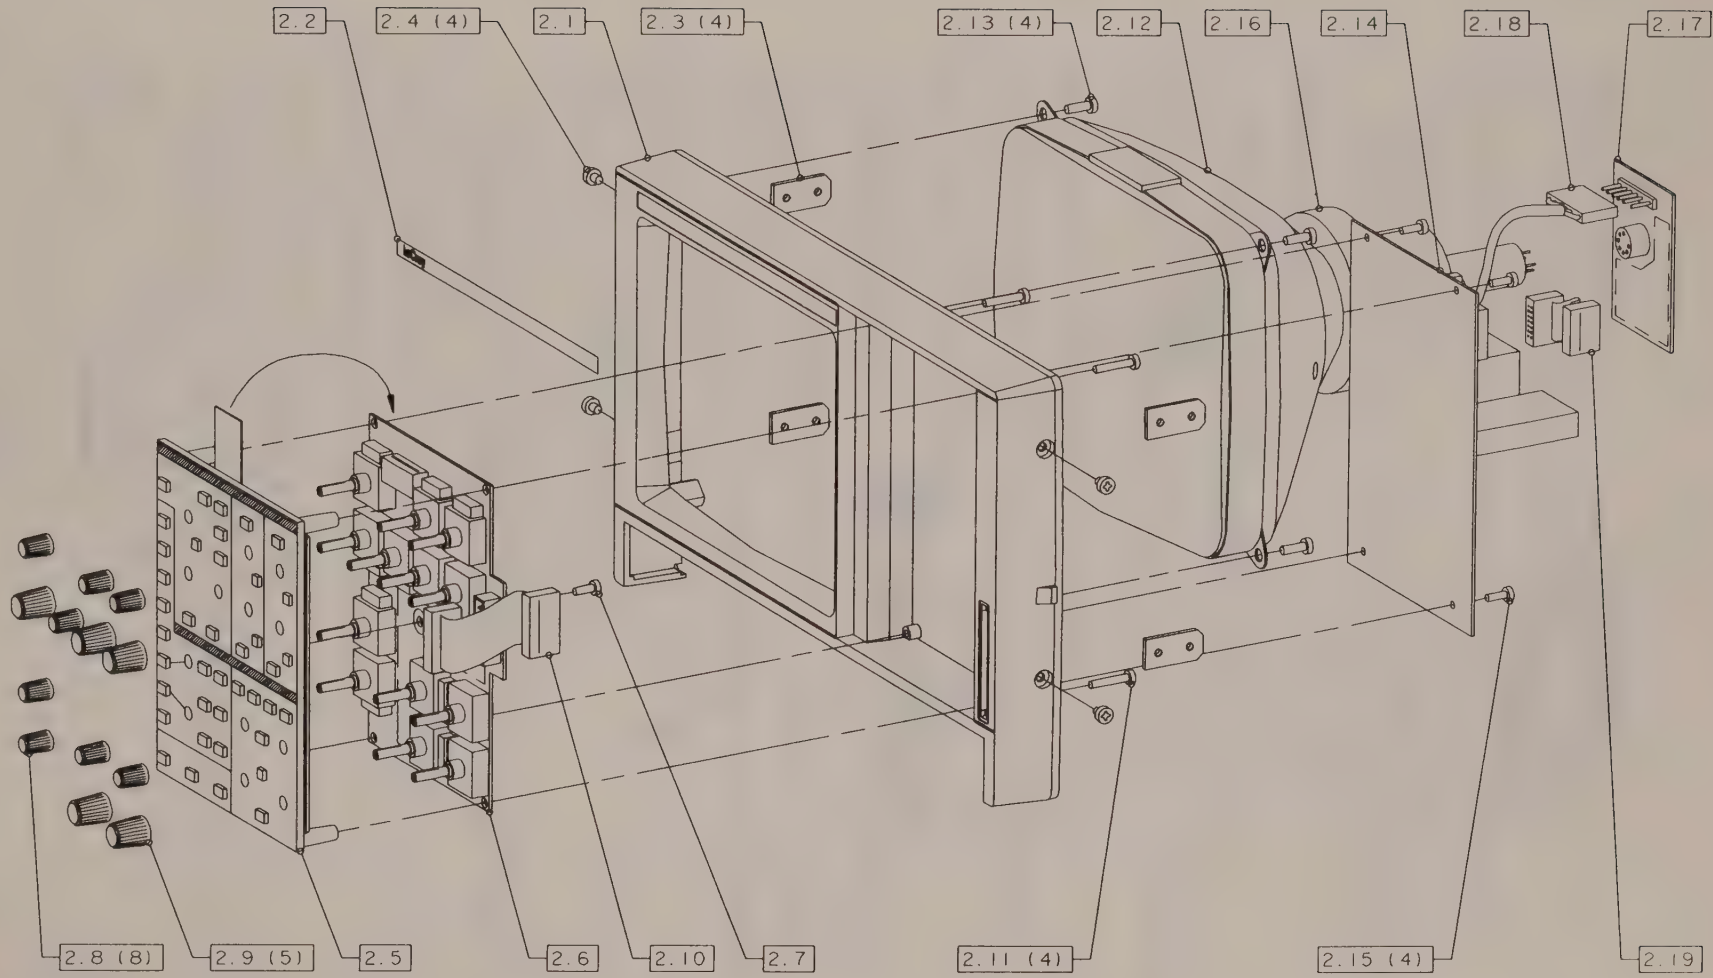

FIGURE 7.3: 9310 FRONT FRAME EXPLODED VIEW

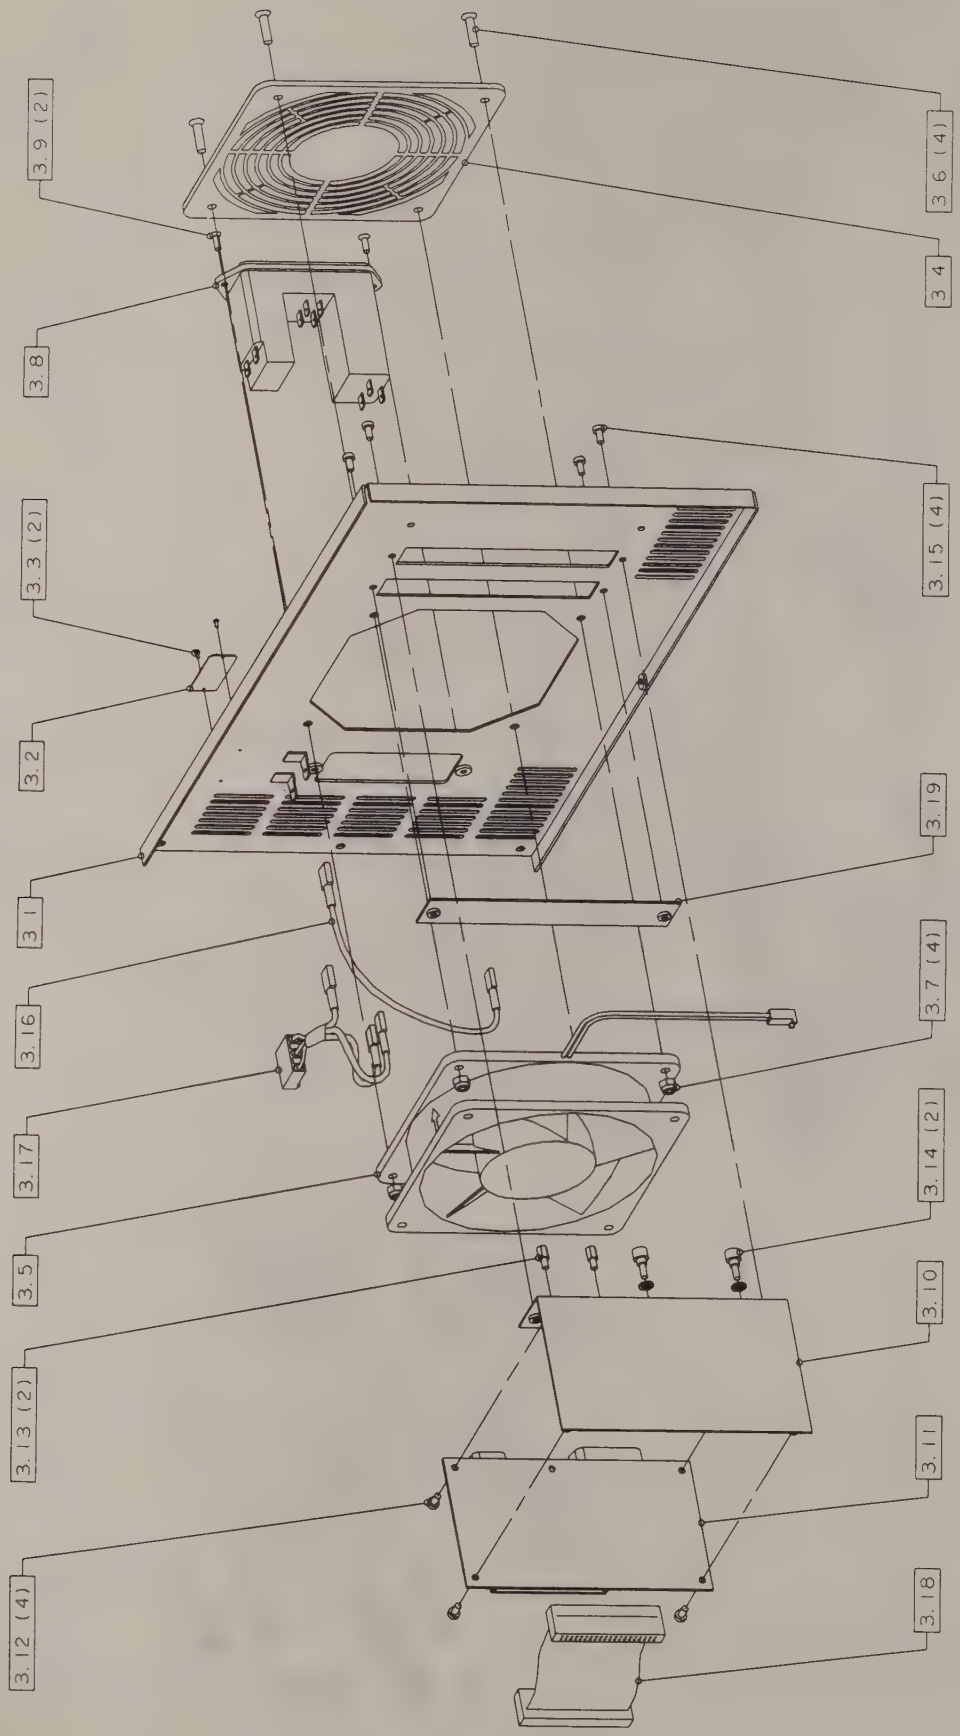

FIGURE 7.4: 9310 REAR PANEL EXPLODED VIEW

7.2.3 Removal of the 93XX-PS 1715 Power Supply (4)

W A R N I N G

Ensure the line cord is disconnected. Remove the following:

- Top cover (7.2.2).
- One M4X8 screw (5.3) from left side of the bottom cover (1).
- Two M4X8 screws (5.1) from left side of the rear panel (3).

Disconnect the following:

- Base card power cable (5.5) from connector J2.
- PS1715 line input cable (3.17) from connector J6.

The power supply can now be removed vertically from the oscilloscope.

7.2.4 Removal of the F9300-4 GPIB/RS232 Interface (3.11)

The GPIB/RS232 interface (3.11) is vertically mounted on the rear panel (3.1).
Remove the following:

- Top cover (7.2.2).
- Two M3x6 screws (3.15) and washers from the rear panel (3.1).

Disconnect the flat cable (3.18) from the processor board (1.22) connector J5.
The GPIB/RS232 board can be removed forwards from the rear panel.

7.2.5 Removal of the Fan (3.5)

Remove the following:

- Top cover of 9310 (7.2.2)
- Four screws (3.6) and nuts (3.7) from the rear panel (3.1).
- Disconnect the fan power cable from the main card F9310-3 connector J3.
- Remove the fan grid (3.4).

The fan (3.5) can be removed from the unit.

C A U T I O N

Note the air flow, the fan extracts air from the unit and expels it.

7.2.6 Removal of the Fuse Holder

W A R N I N G

Disconnect the power cord.
Remove the following:

- Top cover (7.2.2).
- Two screws (3.9) from the rear panel.
- Disconnect the power cable (3.17) from the power supply connector J6.
- Disconnect the earth cable (3.16).

The fuse holder assembly (3.8) can be removed from the rear panel (3.1).

7.2.7 Removal of the 93XX-Video (2.17)

- Remove the top cover (7.2.2).
- Disconnect the ground cable from CRT (black wire)
- Disconnect the monitor cable (2.18) from the deflection board, connector W202 and W203.

Ease the video board (2.17) carefully toward the back of the DSO, until it is free.

7.2.8 Removal of the 93XX-Yoke (2.16)

- Remove the top cover (7.2.2).
- Remove the 93XX-video board (7.2.7)
- Disconnect the cable from the deflection board connector W201.
- Loose the screw on the yoke ring holder.

The deflection yoke (2.16) can be removed from the cathode ray tube (2.12).

7.2.9 Removal of the front frame Assembly (2)

Remove the following:

- Top cover (7.2.2)
- Two screws (5.6) that secure the front frame assembly (2) to the lower cover (1).
- Disconnect the front panel flat cable (2.10) from the processor board (1.22) connector J4.
- Disconnect the deflection flat cable (2.19) from the processor board (1.22) connector J6.

The front frame assembly (2) with the CRT (2.12), yoke (2.16), video (2.17), deflection (2.14), front panel (2.6) and keyboard (2.5) can with care be removed forward from the unit.

C A U T I O N

Hold the CRT very carefully, or place soft padding under it.

7.2.10 Removal of the 93XX-Deflection (2.14)

The deflection board (2.14) is situated to the back of the front panel (2.1).

Remove the following

- Top cover (7.2.2).
- Front frame assembly (7.2.9).
- Disconnect the monitor cable (2.18) which lead to the video board (2.17), connector W202 and W203.
- Disconnect the cable from the deflection yoke, connector W201.
- Disconnect the EHT plug from the receptable at the right side of the CRT (2.12).

W A R N I N G

Touch the free end of the EHT cable to the ground, this ensures that no significant charge remains. The CRT must be discharged similarly, using a tool or a long screw driver which is first placed to the ground and on the CRT receptable.
Remove the four M35x10 screws (2.15) that secure the deflection board to the plastic front frame. The board (2.14) can now be removed from the unit.

7.2.11 Removal of the 93XX-CRT (2.12)

It is necessary to remove the front frame assembly (7.2.9). The CRT is secured to the plastic front frame by four screws (2.13).

- Remove the 93XX-video (7.2.7).
- Remove the 93XX-yoke (7.2.8).
- Disconnect the EHT cable from the deflection board.
- Discharge the tube.
- Remove the four screws.

The CRT can now be removed from the front frame.

W A R N I N G

Use care when handling the CRT. Avoid striking it on any object which may cause the tube to implode. Store the cathode ray tube face down on a soft surface.

To avoid electrical shock the CRT should be discharged after the 9310 oscilloscope is powered OFF. After disconnecting the EHT plug ground the CRT anode lead to the metallic display support repeat the operation to fully dissipate the charge.

7.2.12 Removal of the F9310-5 Front Panel (2.6)

Remove the following:

- Upper cover (7.2.2).
- Front frame assembly (7.2.9).
- 93XX-deflection board (7.2.10).
- Four screws (2.11) that secure the front panel.

The front panel (2.6) with the keyboard (2.5) can be removed forward from the unit.

7.2.13 Removal of the 9310 Keyboard (2.5)

Remove the following:

- Upper cover (7.2.2).
- Front frame assembly (7.2.9).
- 93XX-deflection board (7.2.10).
- F9310-5 front panel (7.2.12).
- The 11 rotary knobs (2.8 and 2.9).

C A U T I O N

Take great care of the soft plastic.

- One screw (2.7) that secures the keyboard to the front panel.
- Disconnect the flat ribbon cable from the front panel connector J2.

C A U T I O N

When removing or installing the keyboard or the front panel, be careful of the fragile flat ribbon cable and connector.

7.2.14 Removal of the F9300-1 or F9314M-1 Processor (1.22)

The processor board is located along the right side of the instrument.

Remove the following:

- Top cover (7.2.2).
- Front frame assembly (7.2.9).
- Two M3x6 screws (1.24) and washers that secure the processor to the brackets (1.20).
- Disconnect the flat cable (2.19) from the F9300-4 GPIB interface connector J5. The processor can be removed vertically from the main card (1.9) F9310-3 connector J1.

C A U T I O N

Static electricity can damage components (RAM, Eproms, microprocessor...). Antistatic precautions are required.

7.2.15 Removal of the F9310/M/L-3 Main Card (1.9)

Remove the following:

- Top cover (7.2.2).
- Front frame assembly (7.2.9).
- Power supply (7.2.3).
- Processor (7.2.14).

The main board is horizontally mounted to the lower case cover (1.1) and secured by three M3x6 screws (1.18), two M3x8 screws (1.21), three M3x16 (1.19) and three M3x6 flat head screws (1.17).

- Remove the eleven screws and two brackets (1.20)
- Disconnect the fan cable from connector J3. The main board can be removed from the scope.

C A U T I O N

Antistatic precautions are required.

7.2.16 Removal of the Handle (1.4)

The handle with two black end caps is secured to the right side of the lower cover (1.1) by two screws (1.5) and washers (1.6).
- Remove the upper cover (7.2.2), processor board (7.2.14).

The handle can be removed from the lower case.

7.2.17 Removal of the Foot Support (1.8)

The two foot supports are clipped on the lower cover (1.1).
Remove the foot (1.7) or the support (1.8) by inserting a small flat screwdriver under the support

7.2.18 Removal of the 93XX-FD01 Floppy Disk Drive Option

- Remove the upper cover (7.2.2).
- Disconnect the flat ribbon cable from the F9300-6 interface (see figure 7.5).
- Remove the two M3x6 screws that secure the floppy drive support to the upper cover.
- Remove the support 70FD01021 and frame 70FD01031 from the cover.
- Remove the four M2.5x4 screws that secure the floppy to the support

The floppy disk drive can be removed from the frame

7.2.19 Removal of the 93XX-GP01 Graphic Printer and F9300-7 Controller Option

- Remove the upper cover (7.2.2).
- Disconnect the power cable (780210030) from the 93XX-PS1715 power supply (see figure 7.6).
- Disconnect the flat ribbon cable (780791604) from the F9300-7 controller (see figure 7.6).
- Disconnect the flat ribbon cable (780721022) between the F9300-6 interface and F9300-7 controller.
- Remove the four M3x6 screws that secure the F9300-7 controller to frame (70GP01031).
- Remove the F9300-7 controller
- Remove the two M3x6 screws that secure the printer to the frame

The graphic printer can now be removed from the upper cover.

7.2.20 Removal of the F9300-6 Centronics Interface Option

- Remove the upper cover (7.2.2).
- Remove the two M3x6 screws from the rear panel
- Disconnect the flat cable from the F9300-4 GPIB/RS232 board (see figure 7.5 or 7.6).

The graphic printer, floppy disk drive, and centronics interface board can be removed forward from the rear panel.

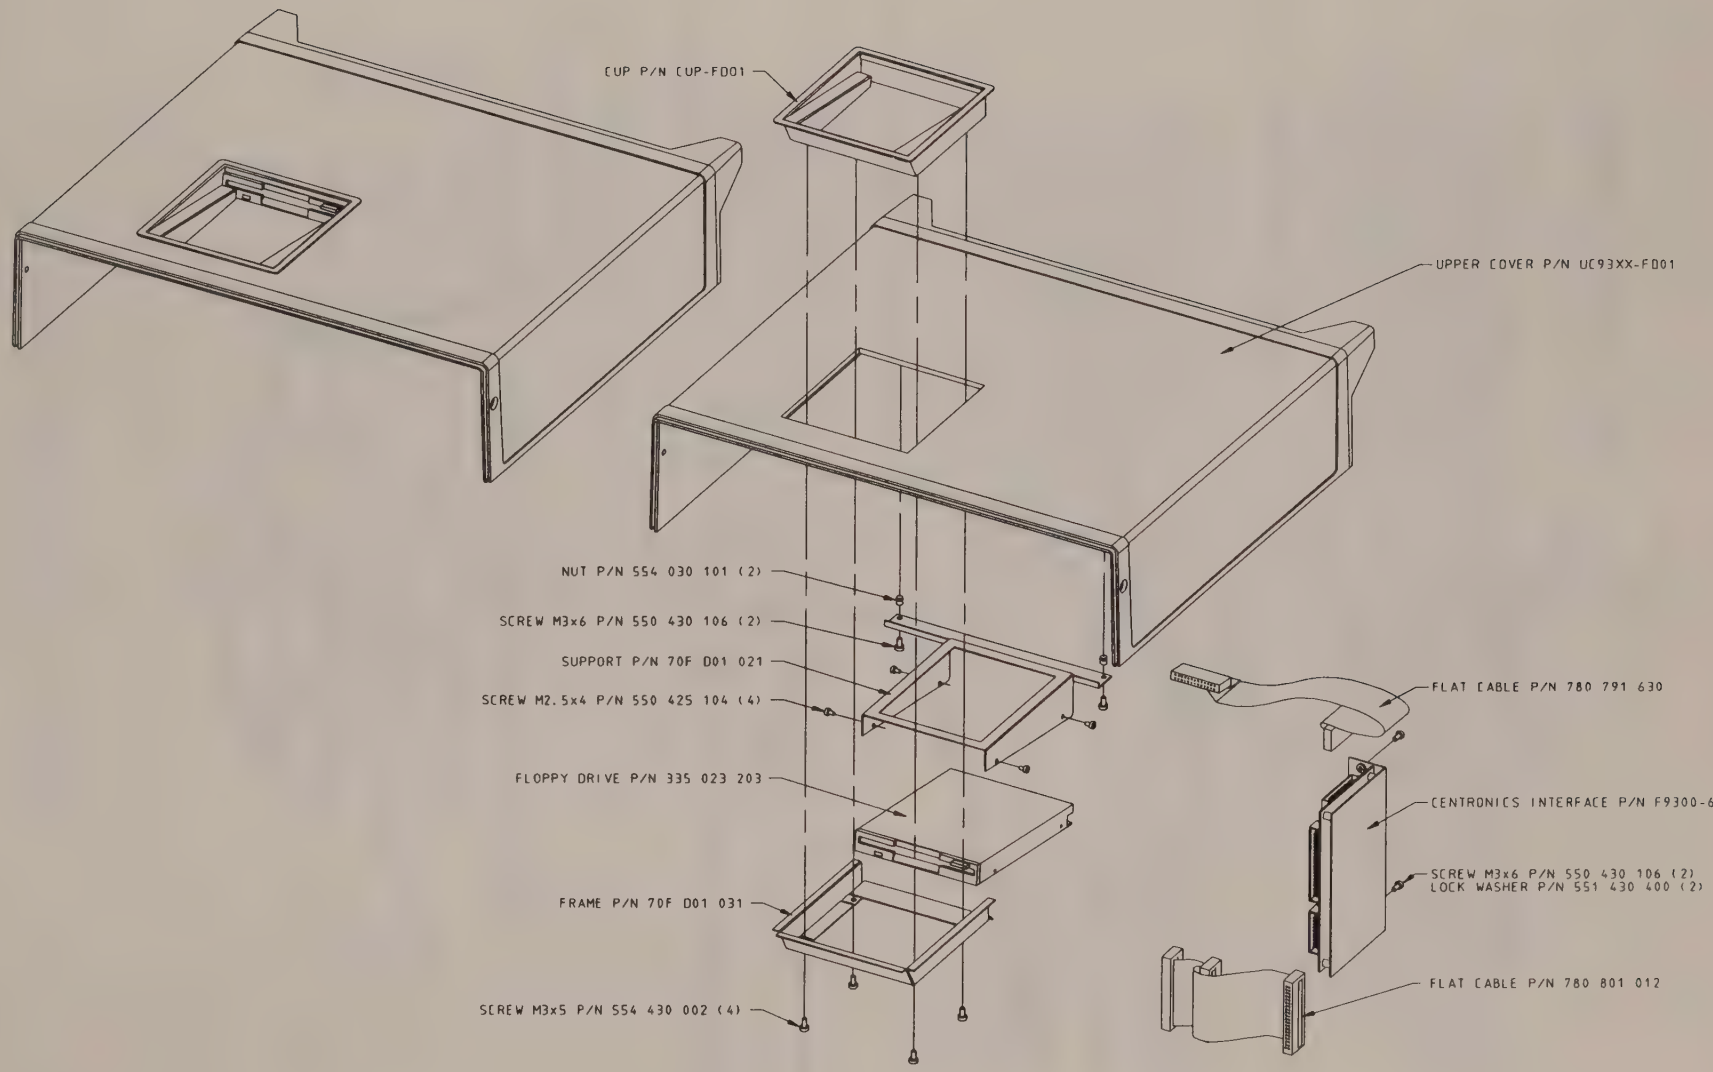

FIGURE 7.5: 93XX-FD01 OPTION ASSEMBLY

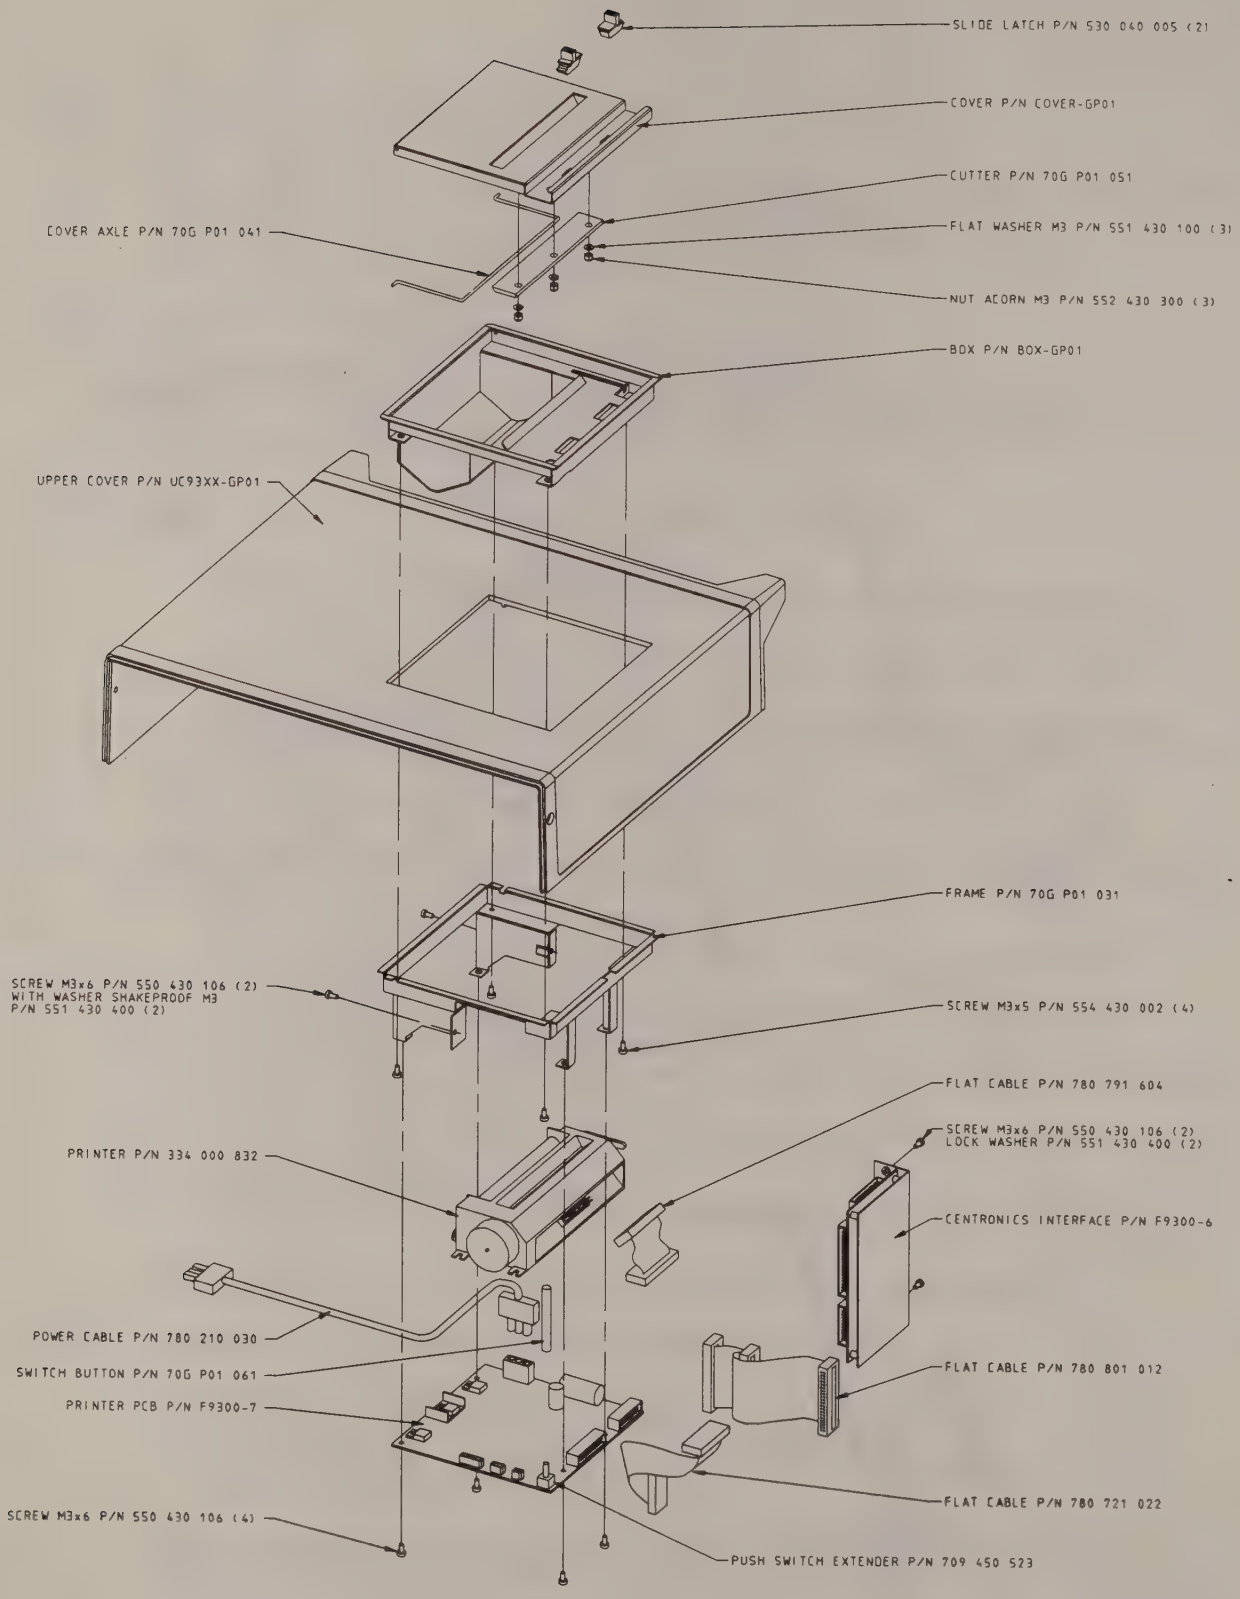

FIGURE 7.6: 93XX-GP01 OPTION ASSEMBLY

7.3 Software Upgrade Procedure

The processor board carries the program memory (768 Kbytes) contained in four Eproms (Loc A22, A27, A29, A38), the character font Eprom (Loc A1) used by the graphic processor of the raster scan display, and the software option selection GAL (Loc A19). After any software change, a general instrument reset is mandatory. Simultaneously press the autosetup button, the top menu button and the return button.

7.3.1 Upgrading Firmware

LeCroy Corporation has a policy of continually improving and upgrading its products. The firmware can be upgraded to the latest version by changing the four Eproms 1H, 1L, 2H, 2L on the processor board at locations A22, A27, A29 and A38 (see figure 7.7). Access is possible by removing the upper cover (7.2.2).
The Eproms can be removed by using an IC extractor. Make sure that the guiding notch in the chip is aligned with the PCB. Same procedure for the character font Eprom at location A1.

7.3.2 Changing Software Options

The software option selection GAL is located on the processor board at location A19 (see figure 7.7). Insert or replace the GAL to select new options.
Make sure that the orientation notches are correctly aligned with the PCB.

7.3.3 Software Option Selection GAL

As of today the following software options are available:

0000:	Standard	GAL not necessary
0001:	WP01	Advanced Math package
0002:	WP02	Basic FFT package
0200:	CARD	Memory card

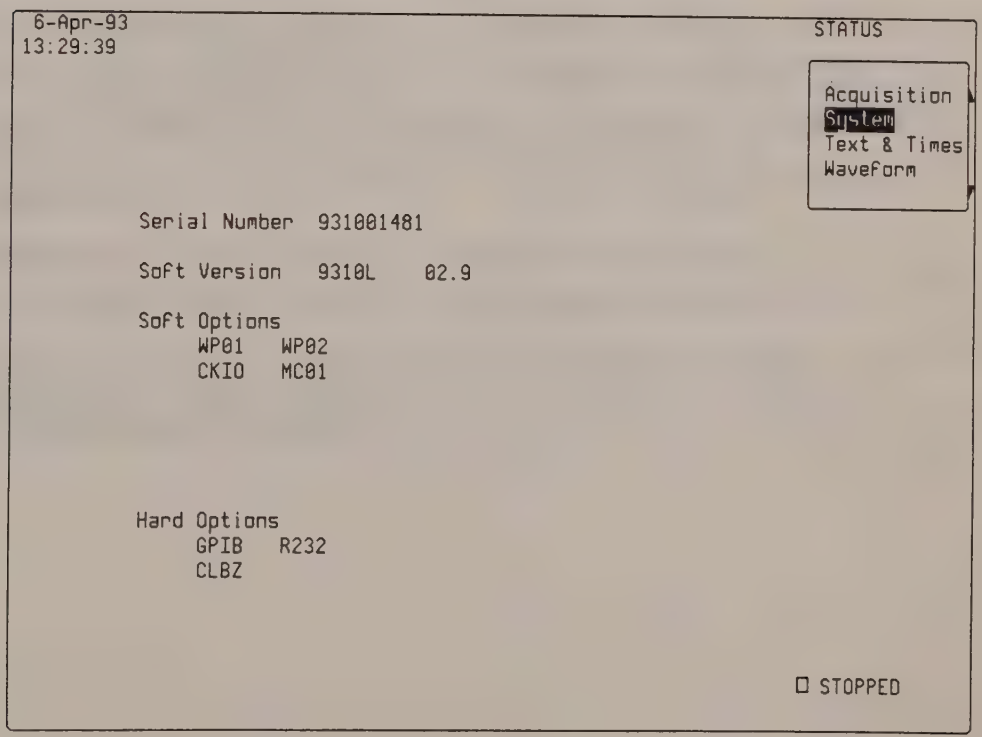
GAL CLE XXXX-R, XXXX : Software option, R : Release



7.3.4 Processor Board Exchange Procedure

The replacement board is supplied without any firmware or options. Therefore the existing GAL (Loc A19) and eproms (Loc A22, A27, A29, A38) must be transfered from the faulty board to the new board. After upgrading firmware or changing the software option, check that the scope boots correctly. Then check in the system summary, by using the show status button on the front panel, the software version, software options and serial number.

The serial number of the 9310 oscilloscope is loaded in the real time clock memory which is battery backed up. If it becomes necessary to replace the processor board, the serial number must be loaded in the memory of the new board by using LeCroy program " LeCalsoft " under GPIB remote control.

To run " LeCalsoft " type SKP.exe, in the main menu type S, and follow the instructions, use five digits to enter the serial number (i.e. 01481).

7.4 Equipment and Spare Parts Recommended for Service

7.4.1 Equipment

The following equipment is needed to provide the technician access to the 9310 subassemblies during repair and calibration.

1-	Sine wave generator:	Marconi 2019A, 2022C, 2030 or equivalent.
2-	Sine wave generator:	5 volt peak to peak amplitude type SG 503 or equivalent.
3-	DC precision power supply:	Tektronix PS5004 or equivalent.
4-	Digital Multimeter:	Philips 2525 or equivalent.
5-	Digital scope 350 MHz:	LeCroy 9450A or equivalent.
6-	Fast rise time pulser:	LeCroy 4969 (<700ps), equivalent.
7-	BNC coaxial cables:	(5ns, 2ns, 1ns), adapter T BNC, adapter BNC-Jack, 50 Ohm BNC terminator feed through.

7.4.2 Spare Parts

In order to make the repair of 9310 oscilloscope at board level, a minimum stock of boards is at least one each:

- F9300-1 or F9314M-1	:	Processor board
- F9310-3 or F9310M-3 or F9310L-3	:	Main board
- F9300-4	:	GPIB/RS232 interface
- F9310-5	:	Front panel with keyboard
- 93XX-Display	:	Raster monitor kit
- 93XX-PS1715	:	Power supply

If the unit is equipped with the 93XX-FD01 and 93XX-GP01 options :

- F9300-6	:	Graphic printer, Floppy, Centronics Interface
- F9300-7	:	Graphic printer controller
- 334000832	:	LPT5446 Seiko Graphic printer
- 335023203	:	Floppy disk drive

The other parts (fan, fuse holder, scope handle, covers, rear panel...) are not on the above list because they are reliable parts and the probability of failure is very low.

7.5 Troubleshooting and Flow Charts

7.5.1 Introduction

The troubleshooting information contained in this section is intended for use by qualified personnel having a basic understanding of electronics (analog and digital). In order to simplify servicing and minimize downtime, the following list of possible symptoms, likely causes, and troubleshooting steps have been prepared.
Most procedures in this section will allow troubleshooting down to the board level.

Defective circuit boards will be repaired or exchange by the regional LeCroy service office or the local representative (see section 1.4).

The first step in troubleshooting is to check for obvious items like blown fuses. The power supply is the next item to check before proceeding to more detailed troubleshooting, since noise or low power supply voltages can cause a variety of digital and analog problems.

7.5.2 Line Voltage Autoranging

The 9310 oscilloscope operates from a 115 V (90 to 132 V) or 220 V (180 to 250 V) normal power source at 45 Hz to 66 Hz. No voltage selection is required since the instrument automatically adapts to the line voltage which is present. The instrument operates at line frequencies up to 440 Hz. However, at frequencies above 60 Hz, the leakage current from phase to ground slightly exceeds the safety recommendations for industrial instruments in some countries. This current reaches 4 mA Max at 250 V/400 Hz.

7.5.3 Line Fuses Replacement

The power supply of the oscilloscope is protected against short circuits and overload by means of two 5A/250 V fuses located above the main plugs.

W A R N I N G

Disconnect the instrument from the power line and from other equipment before replacing fuses.

To replace line fuses, proceed as follow:

- Turn off the power and disconnect the line cord from the instrument
- Open the fuse box by inserting a small flat screwdriver under the plastic cover and remove the fuse carrier from the holder
- Remove the 5 amp fuse and replace it with the proper type:

  5 amp/250 V, 3AG normal blowing.

  LeCroy part number: 433 162 500

Ok

7.6 Calibration Procedures

The following section includes the adjustments required for the power supply, front end and display. It is recommended that they be verified at one year intervals.

7.6.1 93XX-PS1715 Power Supply Calibration

The four voltages are adjustable by ± 5% of the nominal value. The reference for the measurements are the pins on connector J2 located on the main board.

From right to left:

Pin 10:	-15.1 V	(Min = -14.85 V, Max = -15.15 V)
Pin 9:	+15.1 V	(Min = +14.85 V, Max = +15.15 V)
Pin 8:	- 5.2 V	(Min = - 5.15 V, Max = - 5.25 V)
Pin 6:	GND	
Pin 5:	+ 5.2 V	(Min = + 5.15 V, Max = - 5.25 V)

For the calibration of the power supply proceed as follow:

- Turn off the power
- Remove the top cover (7.2.2)
- Remove the front frame assembly (7.2.9) and put it to the right of the unit.
- By using two extension cables, reconnect the processor board to the front panel (J4) and to the deflection board (J6).

The front frame assembly is now reconnected to the processor through the extension cables. The four potentiometers are accessible from the front through holes in the power supply chassis.

Turn on the power and perform the adjustments (see figure 7.8).

Turn the potentiometer clockwise to increase the tension or counterclockwise to decrease the voltage.

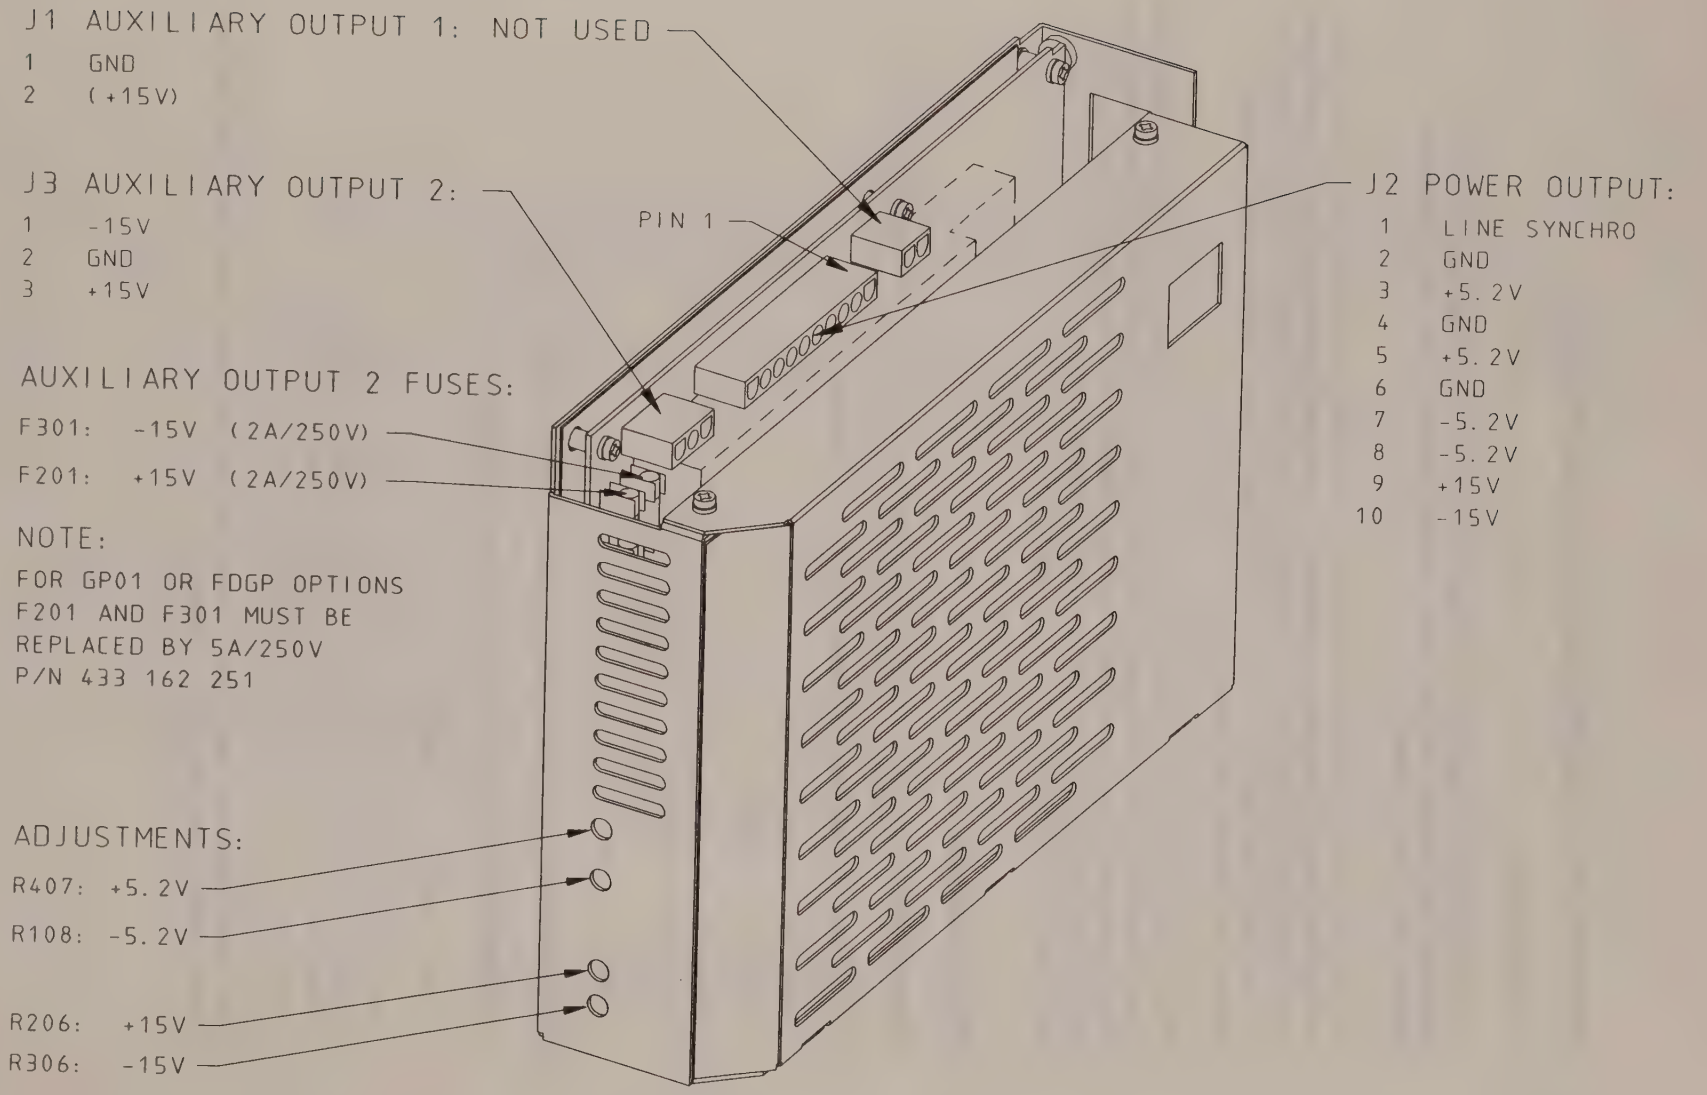

FIGURE 7.8: 93XX-PS1715 POWER SUPPLY

7.6.2 F9310/M/L Front End Test and Calibration Procedure

7.6.2.1 Introduction

The adjustments describe in the following calibration procedure require extension of the front panel assembly out of the scope, using two flat cables.

In order to access the front end potentiometers (overload, gain) and variable caps (flatness, overshoot) located underneath the Cathode Ray tube and deflection board, dismount the front panel assembly from the scope and reconnect it to the processor board connectors J4 and J6, using the extension cable set.

Once the top cover is removed and the front panel is disassembled from the scope, extra cooling of the main board is required. It's mandatory to disconnect the existing Fan from connector J3, located on F9310-3 card, and to use a Fan with the air flow oriented to the front end section of the board.

7.6.2.2 Power Supplies

Remove the front end cover shield to access the Test point TP101.

Check the following voltages with a voltmeter :

```
Pin  1 :  GND
Pin  2 :  GND

Pin  7 :  - 12 V   +/-  0.50 V
Pin  8 :  + 12 V   +/-  0.50 V
Pin  9 :  -  8 V   +/-  0.35 V
Pin 10 :  +  8 V   +/-  0.35 V
```

For connector and test points, see figure 7.10.

On connector J2 check the following voltages :

```
Pin  2,4,6 :     GND

Pin  3,5   :  +  5.1 V :  5.15 V < VCC < 5.25 V
Pin  7,8   :  -  5.1 V :  5.15 V < VEE < 5.25 V
Pin  9     :  + 15.1 V : 14.85 V <  V  < 15.15 V
Pin  10    :  - 15.1 V : 14.85 V <  V  < 15.15 V
```

The four tensions mentioned above are adjustable, see the 93XX-PS1715 power supply calibration procedure.

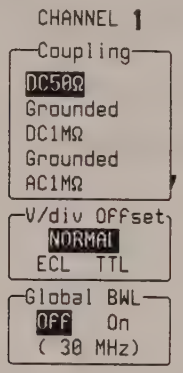
Figure 7.10

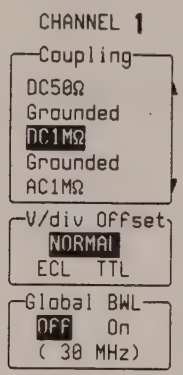
7.6.2.3 Input Impedance

7.6.2.3.1 Channel 1, 50 Ohm.



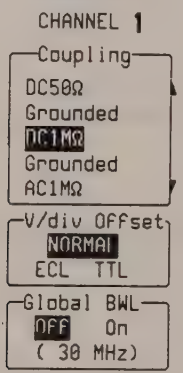
- Set DSO Channel 1 input to 50 Ohm, DC coupling, with any Time base and Gain.
- Check with a high precision DMM :
- input impedance must be 50 Ohm +/- 1%

7.6.2.3.2 Channel 1, 1 MOhm, DC, gain < 200 mV/div



- Set DSO Ch1 input to 1 MOhm, DC coupling, 100mV/div, with any Time Base.
- Check with an ohmmeter :
- input impedance must be 1 MOhm +/- 1%

7.6.2.3.3 Channel 1, 1 MOhm, DC, gain > 100 mV/div

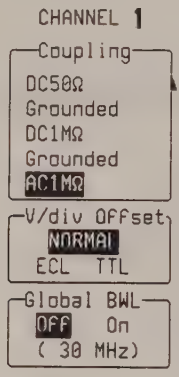


A 1/20 attenuator is used in the front end, when the Gain is greater than 100mV/div.

Repeat 1 MOhm test for 200mV/div

- input impedance must be 1 MOhm +/- 1%

7.6.2.3.4 Channel 1, 1 MOhm, AC, gain < 200 mV/div

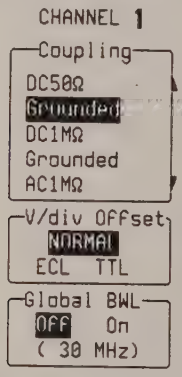


- Set DSO Ch1 input to 1 MOhm, AC coupling, 50mV/div
- input impedance must be 1.01 MOhm +/- 1% or 1 MOhm DC + 10 KOhm.

7.6.2.3.5 Channel 2, Input Impedance

- Repeat all impedance checks for Channel 2.

7.6.2.3.6 Channel 1, 1 MOhm Protective resistor



- Set scope CH1 input to DC 50 Ohm Grounded, with any Time Base and Gain.
- input impedance must be 1 MOhm +/- 2%
- If the impedance is not 1 MOhm, check the SM resistor R1006 or the relay RL1000.

7.6.2.3.7 Channel 2, 1 MOhm Protective resistor

- Set Ch2 input to DC 50 Ohm Grounded, with any Time Base and Gain.
- input impedance must be 1 MOhm +/- 2%.

In case of problem check the SM resistor R2006, or relay RL2000.

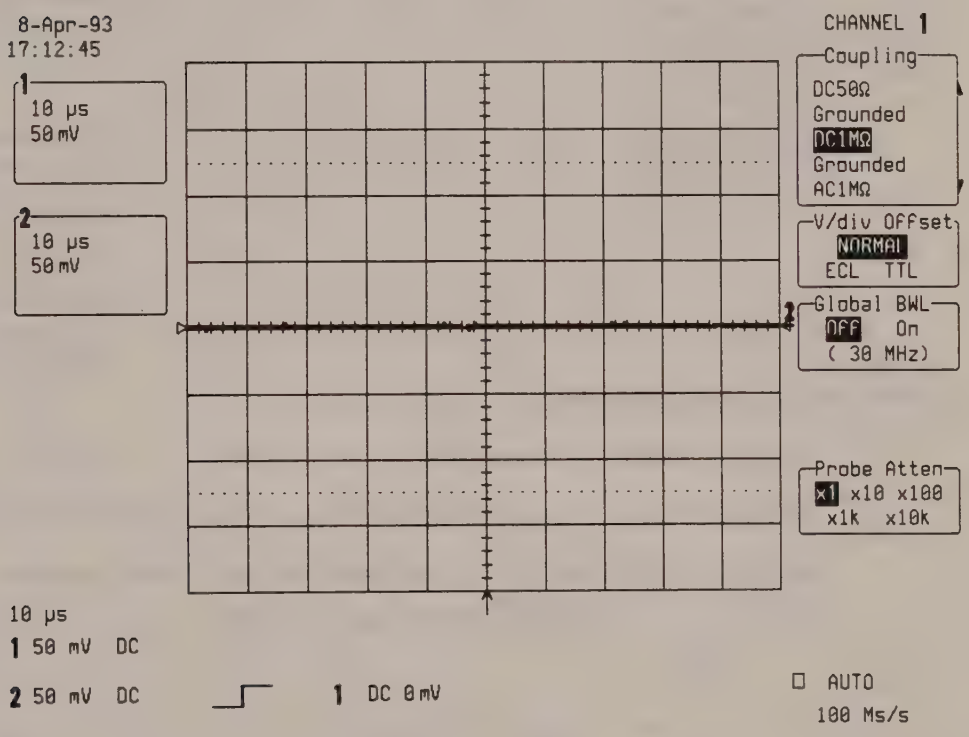
7.6.2.3.8 External Trigger Input Impedance

- Check External and External/10
- input impedance must be 1 MOhm +/-1%

7.6.2.4 Leakage Current

With a high precision DMM, type PM2525 or equivalent (> 10 Mohm) measure the leakage currents in 1 MOhm, DC on Channel 1, Channel 2.

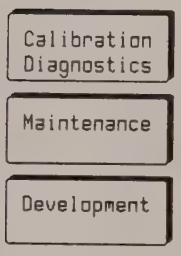
- Set DSO to 1 MOhm, DC, with gain < 200 mV/div
- Connect the DMM in DC mode to the input.
- Reading should not be larger than +/- 200 uV.



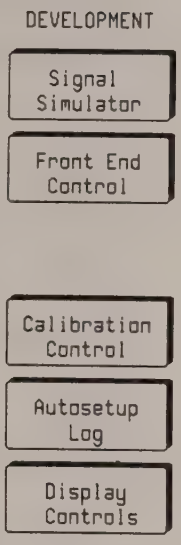
7.6.2.5. 16 bit DAC Calibration

The 9310 Calibration Diagnostics is entered by simultaneously depressing the third and fourth push buttons, and then by depressing the fifth.

- Select Development menu

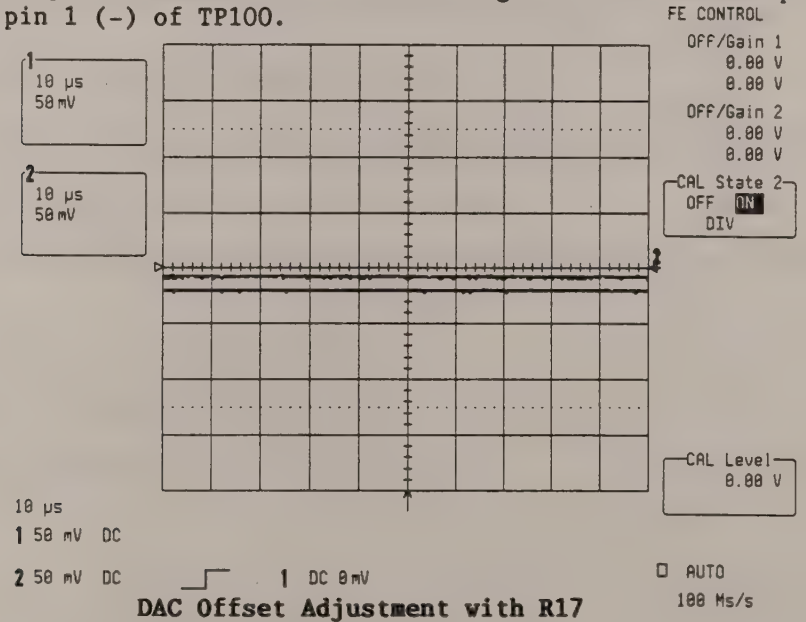


- Select Front End Control menu



7.6.2.5.1 DAC Offset Adjustment

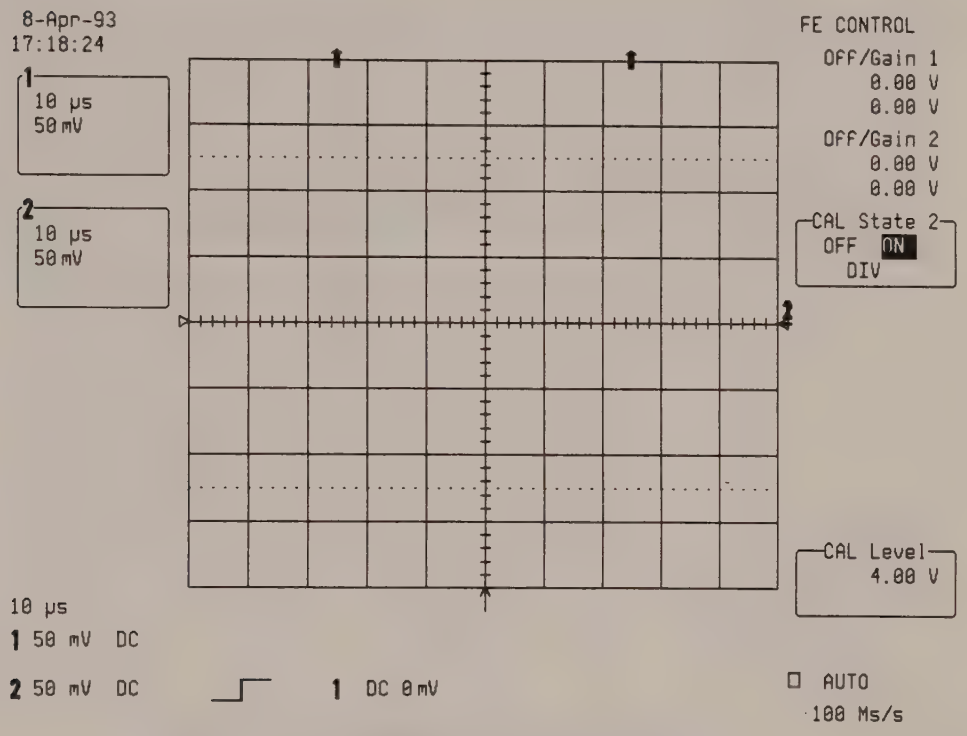
- Set Cal State = ON and Cal Level = 0.00 V
- Set DSO Channel 1 and Channel 2 to 1 MOhm, DC, 50 mV/div
- Adjust potentiometer R17 in order to get 0.00mv between pin 9 (+) and pin 1 (-) of TP100.



DAC Offset Adjustment with R17

7.6.2.5.2 DAC Gain Adjustment

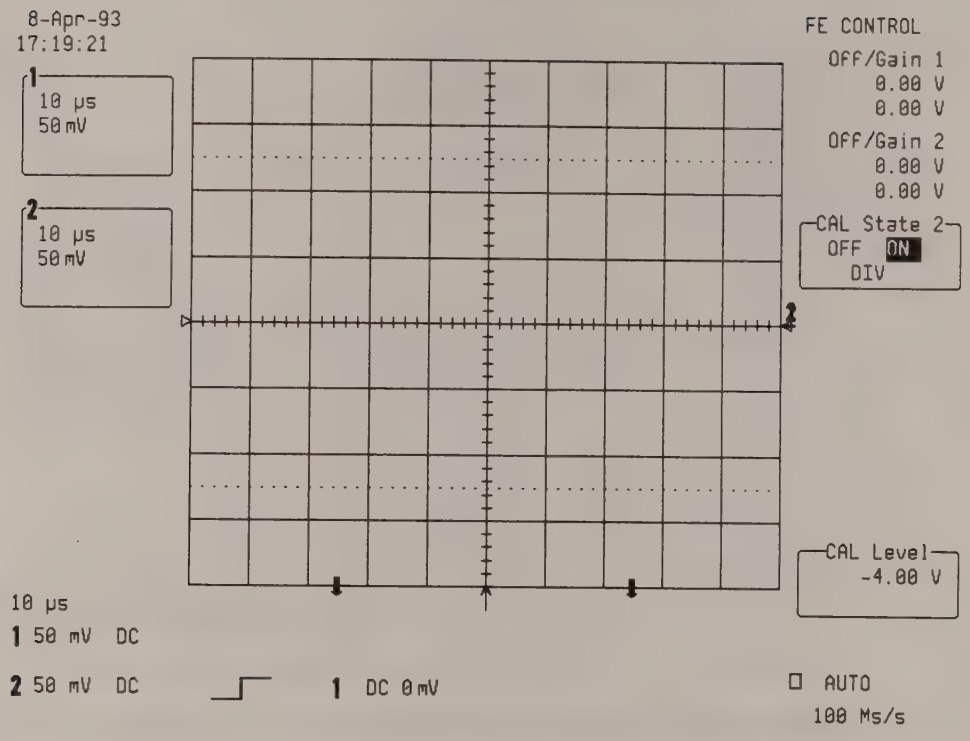
- Set Cal Level = + 4.00 V
- Adjust potentiometer R16 to get + 1.00 V +/- 1% between pin 9 (+) and pin 1 (-) of TP100.



DAC Gain Adjustment with R16

- Set Cal level = - 4.00 V

- check on TP100 pin 9 = - 1.00 V +/- 1%

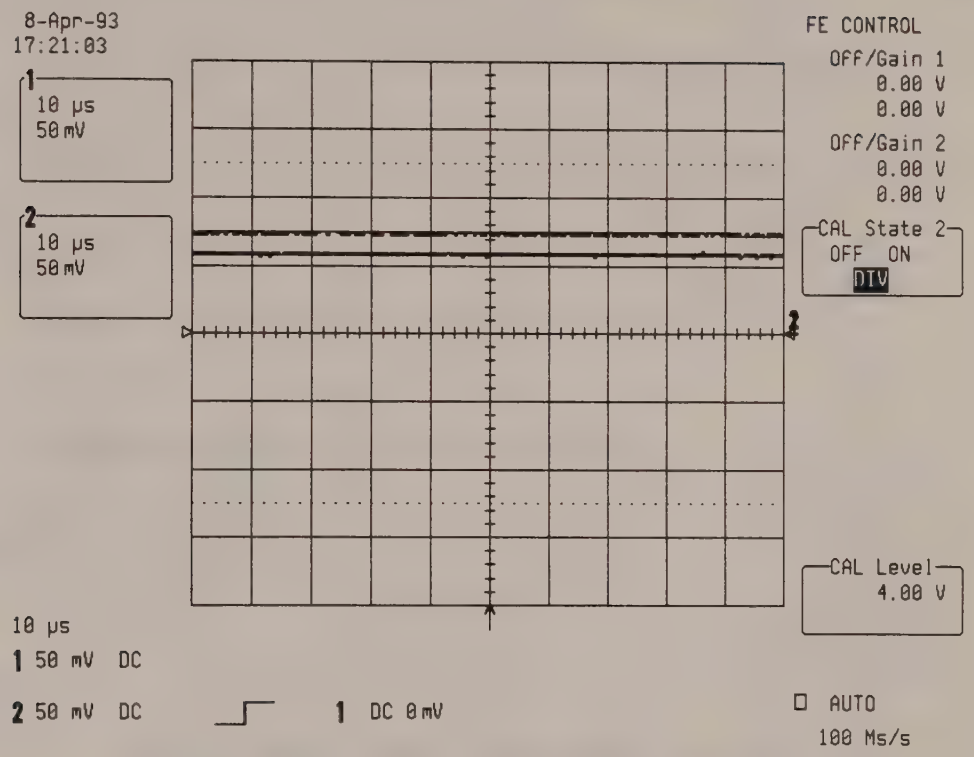


DAC Gain = - 4.00 V

- Set Cal State = Div

- Set Cal Level = + 4.00 V

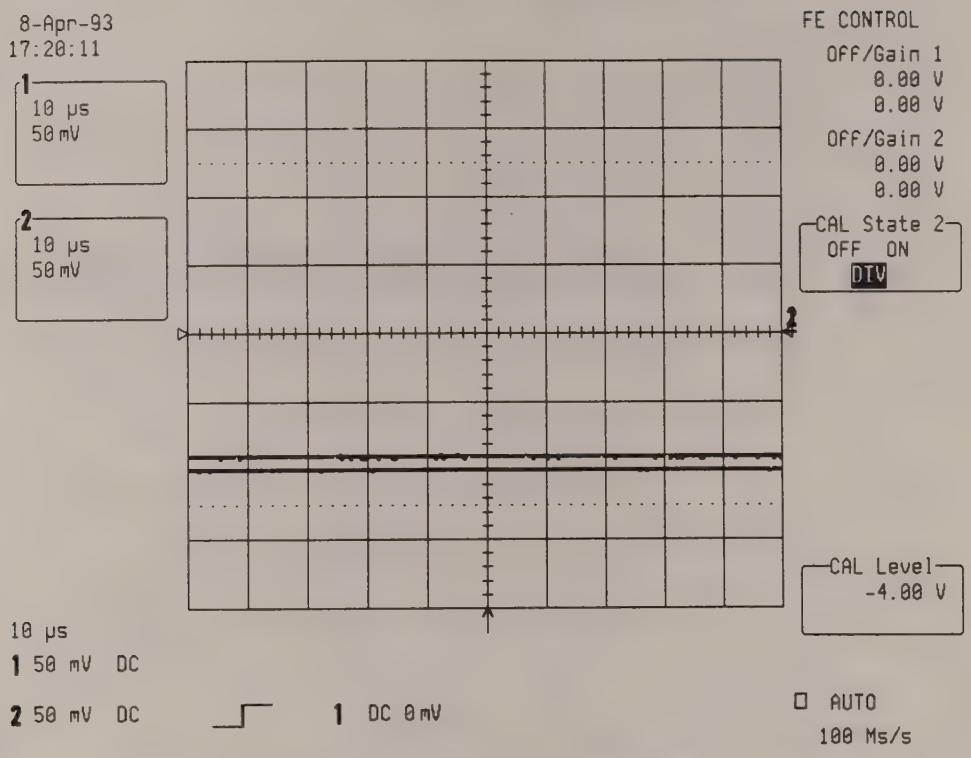
- Check on TP100 pin 9 = + 100 mV +/- 1%



DAC Gain = + 4.00 V, pin 9 = +100 mV

- Set Cal Level = - 4.00 V

- Check on TP100 Pin 9 = - 100 mV +/- 1%

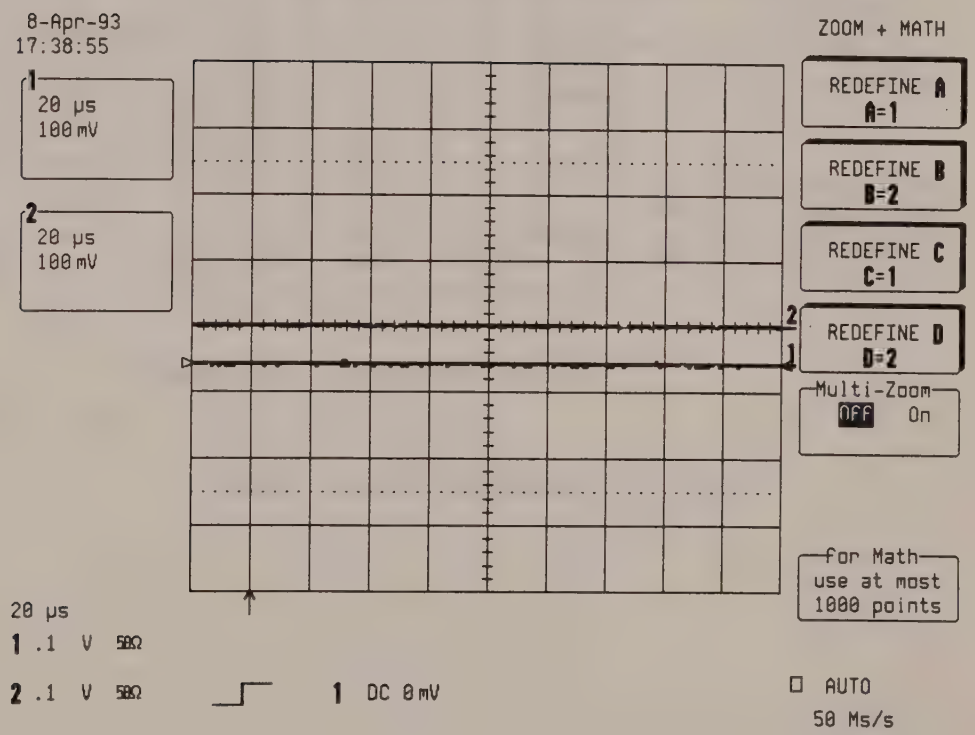


DAC Gain = - 4.00V, pin 9 = -100mv

7.6.2.6 Channel 1 HF Compensation

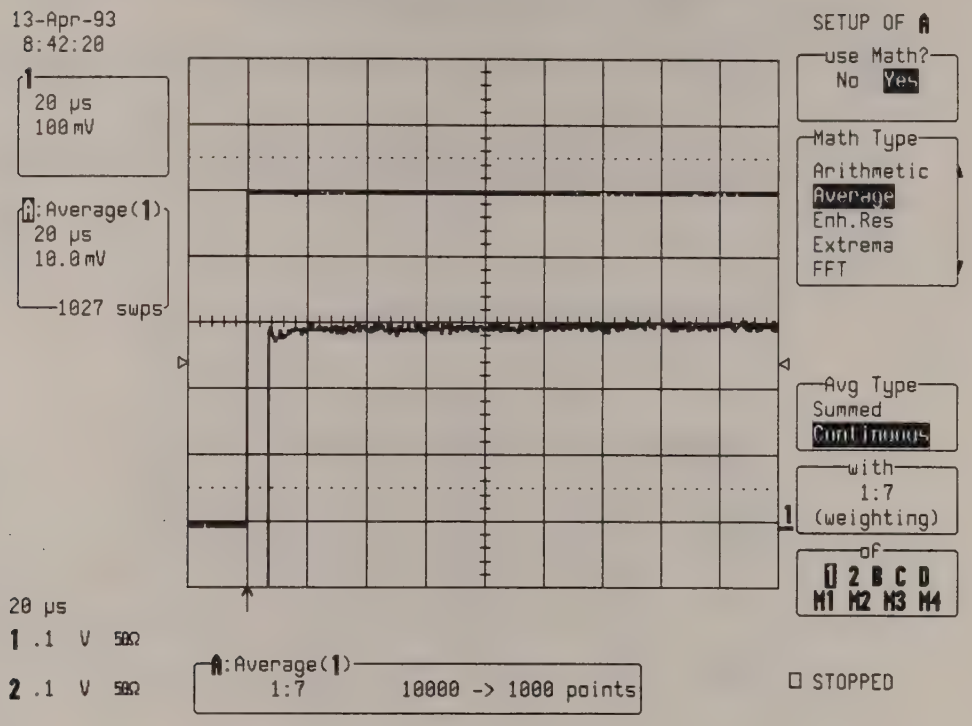
7.6.2.6.1 Channel 1 Input Buffer Flatness Adjustment

- Apply the fast risetime generator LeCroy 4969 (< 700 ps) to Ch1. Set pulser to low frequency (62.5 Ms).
- Set DSO to 50 Ohm, DC, 100mv/div, 20 us/div, Trigger on Ch1, Pos slope.
- Select Math Setup, Redefine A, Average type Summed or Continuous weight 1:7.



- With the vertical Zoom set A to 10 mV

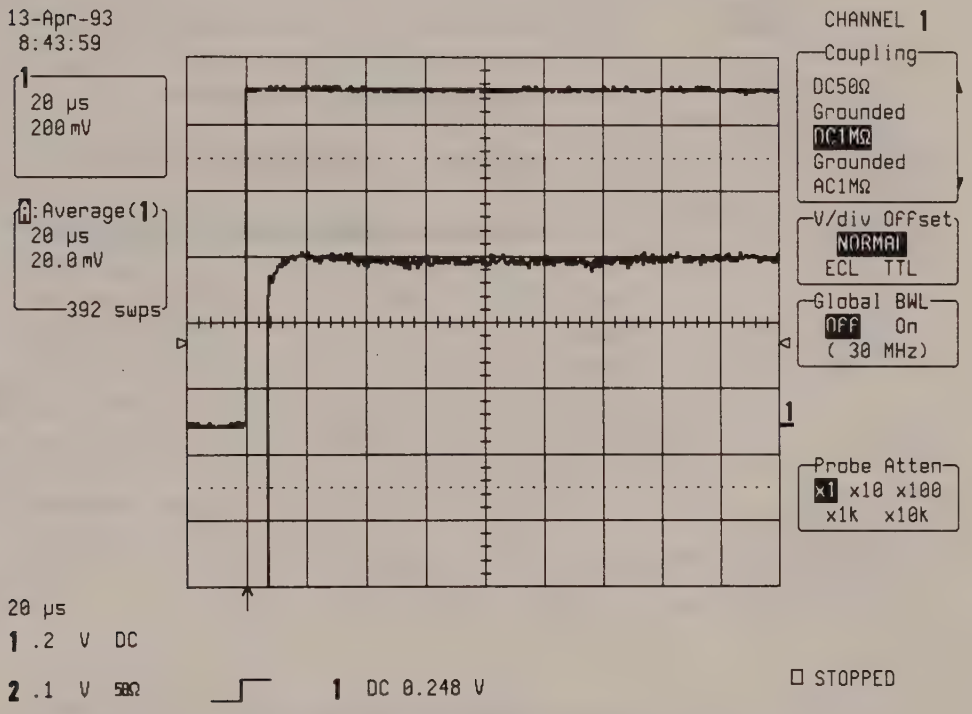
- Adjust Pot R3042 to get a flat square wave, with the top of the overshoot at the same level as the settled value.



Flatness Adjustment with R3042

7.6.2.6.2 Channel 1 1/20 Attenuator Flatness Adjustment

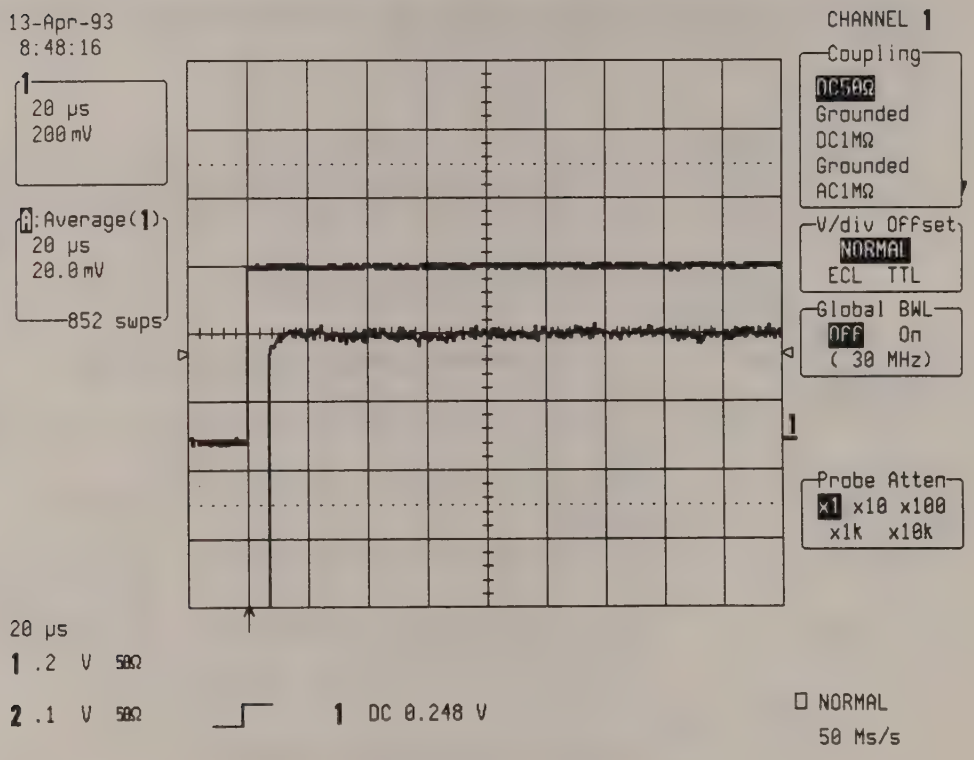
- Set DSO to 1 MOhm, DC, 200 mV/div, 20 us/div, Trigger Ch1, Pos slope.
- Use Average mode type Summed or Continuous weight 1:7.
- Adjust the variable cap C3004 to get a slight negative slope, typically 1% or 1/2 division.



1 MOhm Flatness Adjustment with C3004

- Set DSO to 50 Ohm, DC, 200 mV/div,
- Check the flatness, typically a slight positive or negative slope :

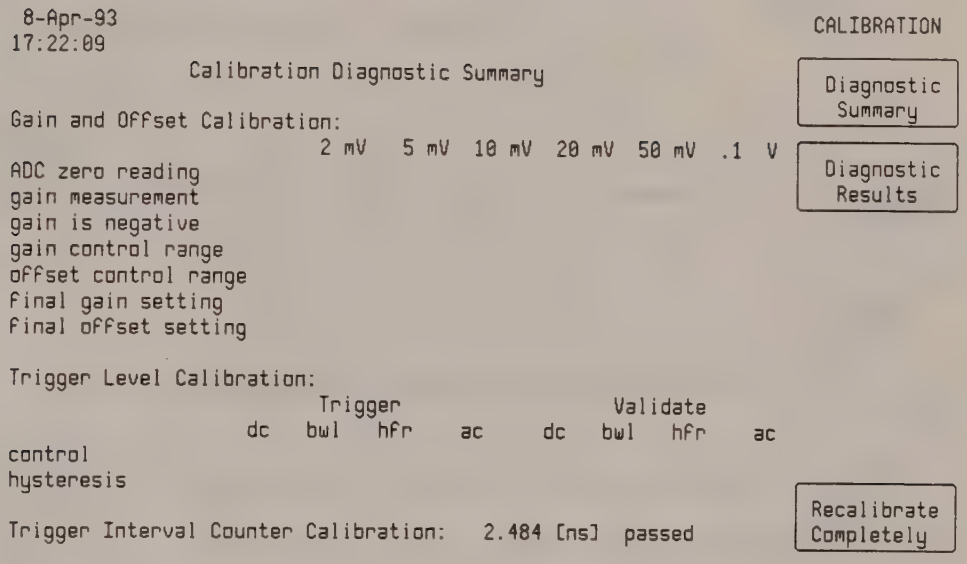
  +/- 1% or +/- 1/2 Division



50 Ohm Flatness Verification

7.6.2.6.3 Channel 1 Input Buffer DC Gain Adjustment

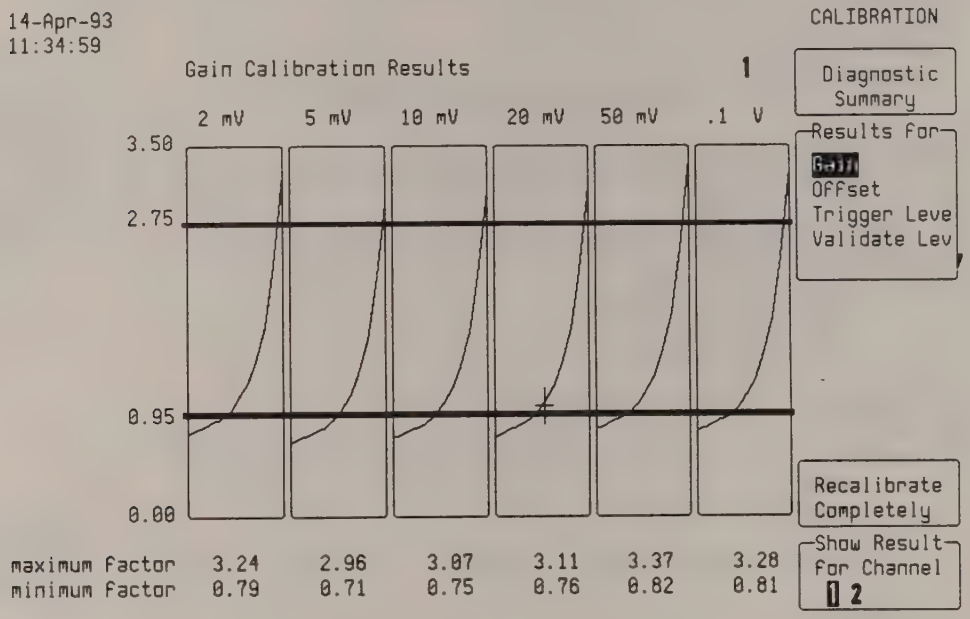
- In the Calibration Diagnostics select Diagnostic Results.



- Select Results for Gain, and Show Result for Channel 1
- During the adjustment push Recalibrate Completely
- Adjust Potentiometer R3081 in order to get

  Maximum Factor at 5 mV/div > 2.85

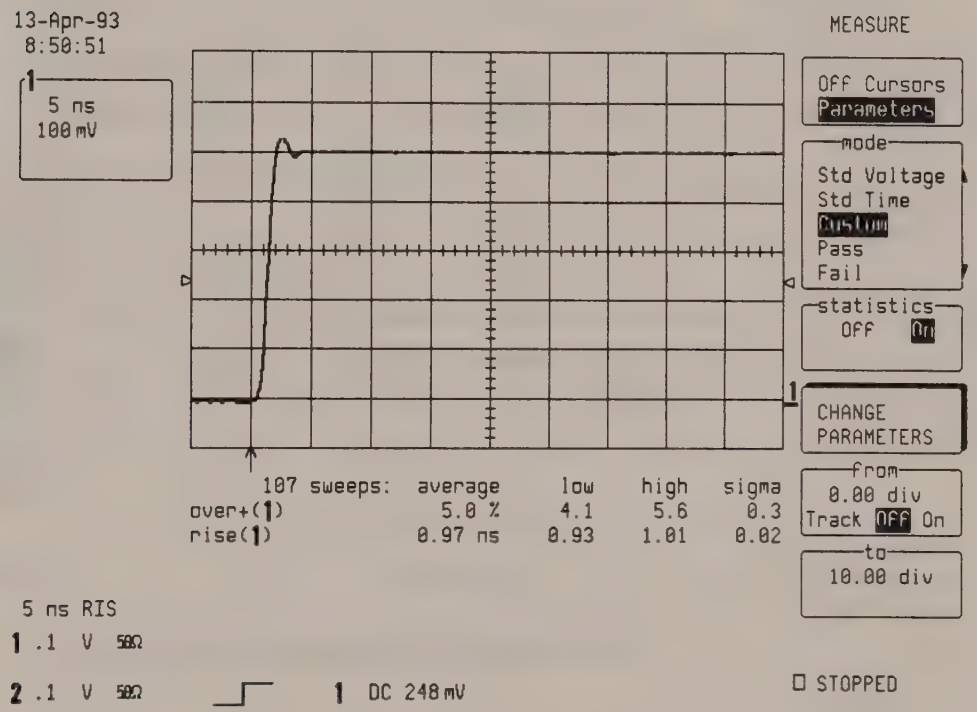
  Minimum Factor at 50 mV/div < 0.85



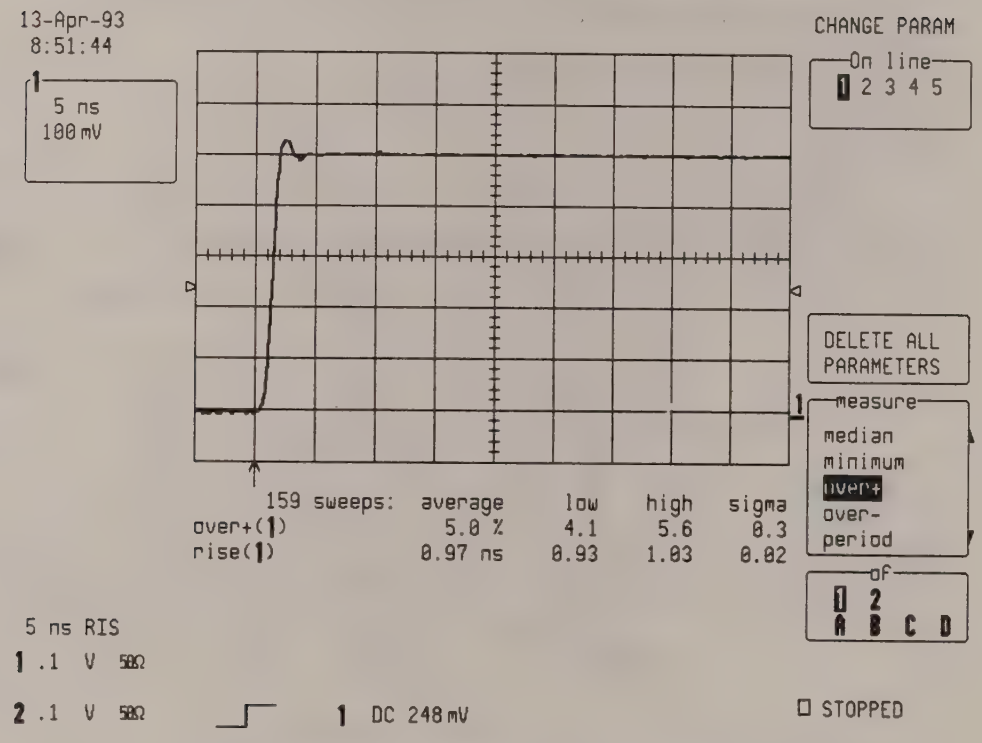
DC Gain Adjustment with R3081

7.6.2.6.4 Channel 1 Overshoot Calibration

- Apply the pulse generator LeCroy 4969 to Ch1, set to 61.05 us period
- Set DSO to 50 Ohm, DC, 100 mV/div, 5ns/div, RIS mode
- Press Cursors/Measure push button,
- Select Parameters menu
- Select Custom menu
- Select Change Parameters menu



- Select On Line 1, Measure Over+ of Ch1
- Select On Line 2, Rise of Ch1
- Adjust C3026 in order to get 5% overshoot +/- 1 %
- Rise time should be < 1.1 ns

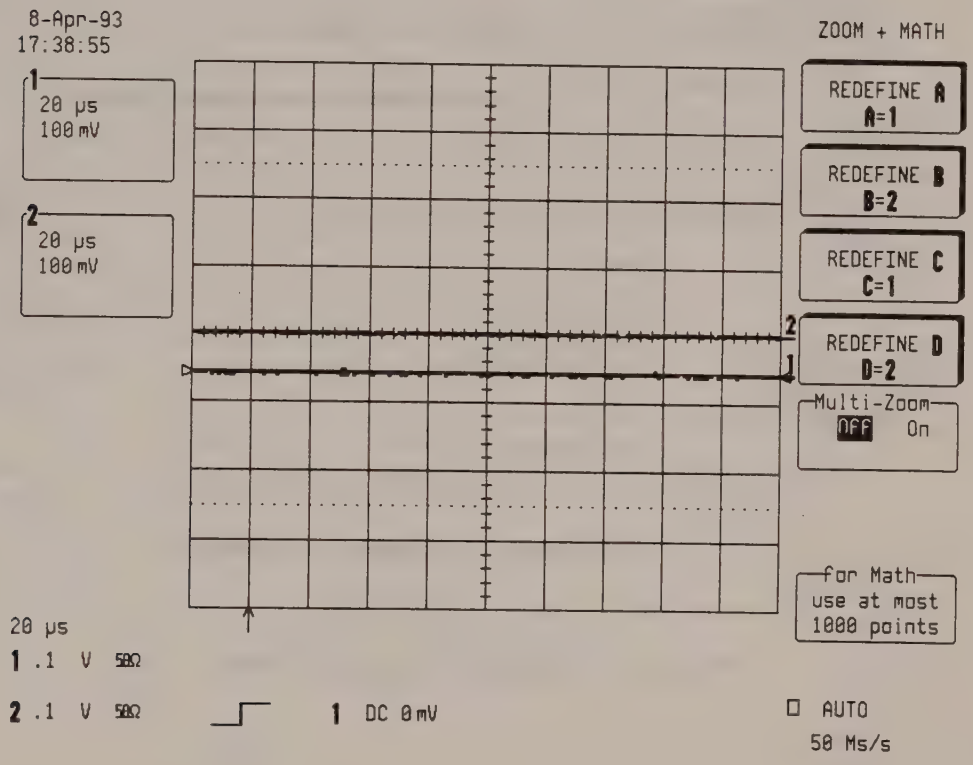


Ch1 Overshoot Compensation with C3026

7.6.2.7 Channel 2 HF Compensation

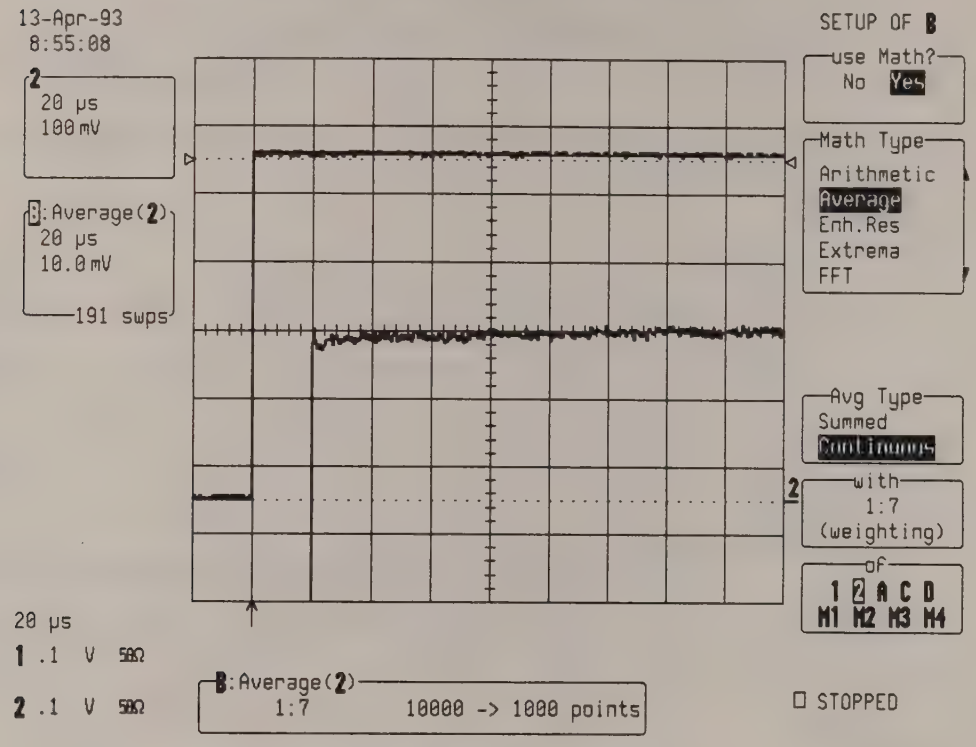
7.6.2.7.1 Channel 2 Input Buffer Flatness Adjustment

- Apply the fast risetime generator LeCroy 4969 (< 700 ps) to Ch2. Set pulser to low frequency (62.5 Ms).
- Set DSO to 50 Ohm, DC, 100mv/div, 20 us/div, Trigger on Ch2, Pos slope.
- Select Math Setup, Redefine B, Average type Summed or Continuous weight 1:7.



- With the vertical Zoom set B to 10 mV

- Adjust Pot R4042 to get a flat square wave, with the top of the overshoot at the same level as the settled value.



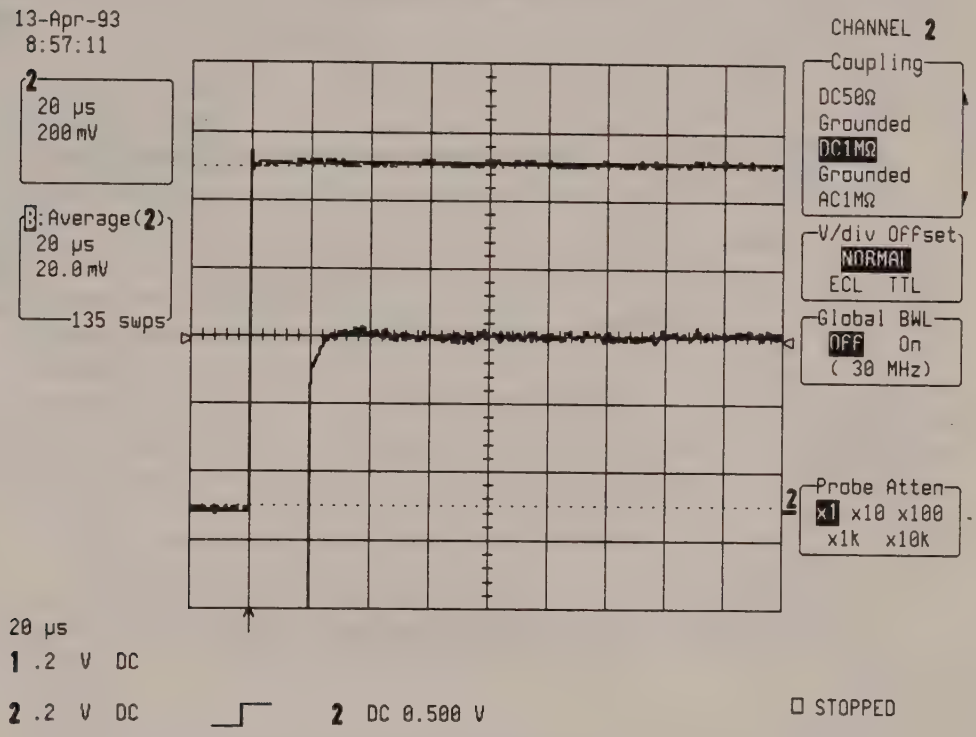
Flatness Adjustment with R4042

7.6.2.7.2 Channel 2 1/20 Attenuator Flatness Adjustment

- Set DSO to 1 MOhm, DC, 200 mV/div, 20 us/div, Trigger Ch2, Pos slope.

- Use Average mode type Summed or Continuous weight 1:7.

- Adjust the variable cap C4004 to get a slight negative slope, 1% or 1/2 division.

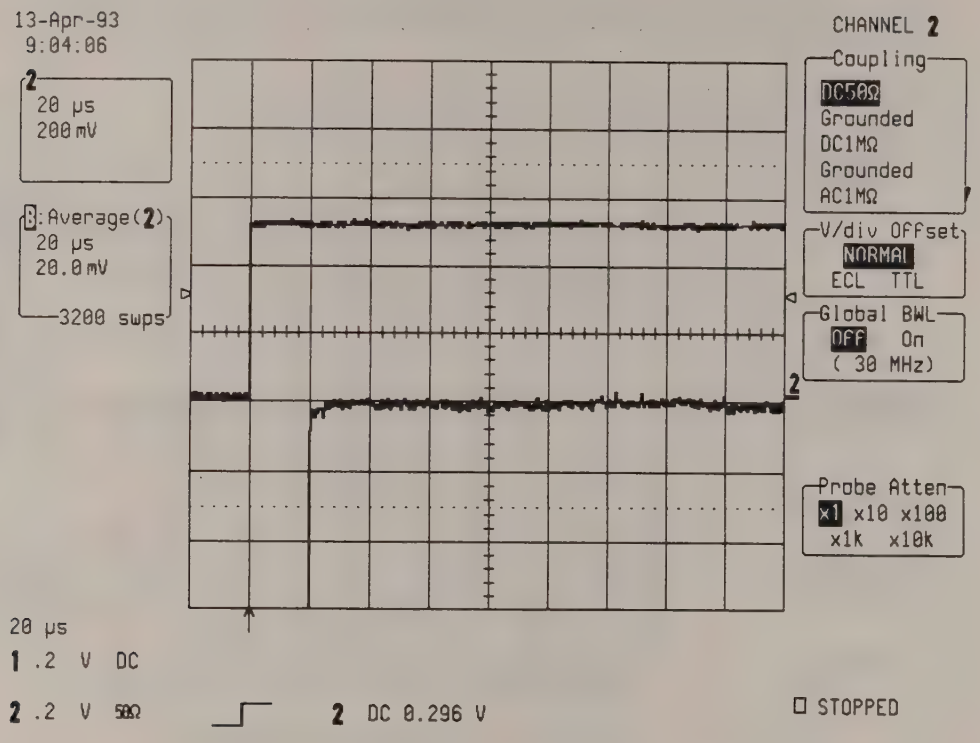


1 MOhm Flatness Adjustment with C4004

- Set DSO to 50 Ohm, DC, 200 mV/div.

- Check the flatness, typically a slight positive or negative slope :

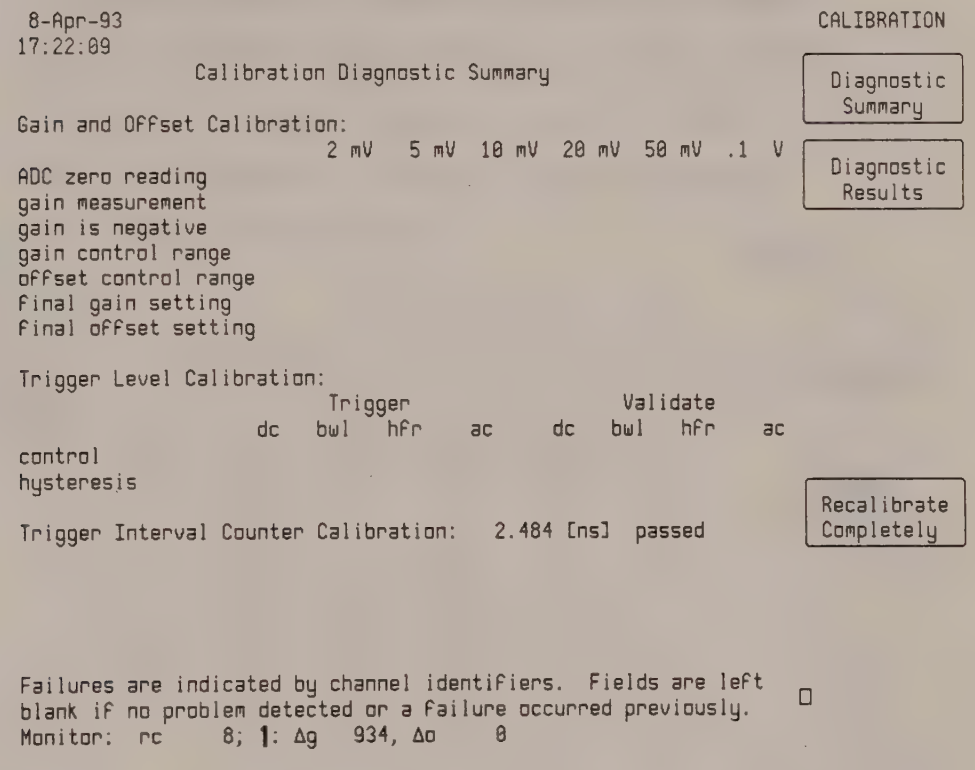
  +/- 1% or +/- 1/2 Division.



50 Ohm Flatness Verification

7.6.2.7.3 Channel 2 Input Buffer DC Gain Adjustment

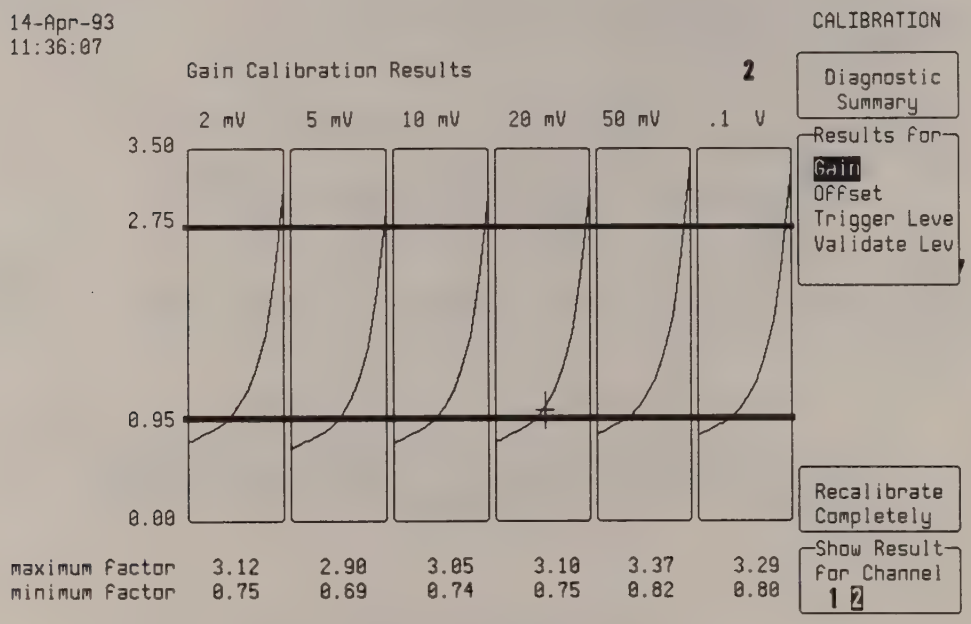
- In the Calibration Diagnostics select Diagnostic Results.



- Select Results for Gain, and Show Result for Channel 2.
- During the adjustment push Recalibrate Completely.
- Adjust Potentiometer R4081 in order to get:

  Maximum Factor at 5 mV/div > 2.85

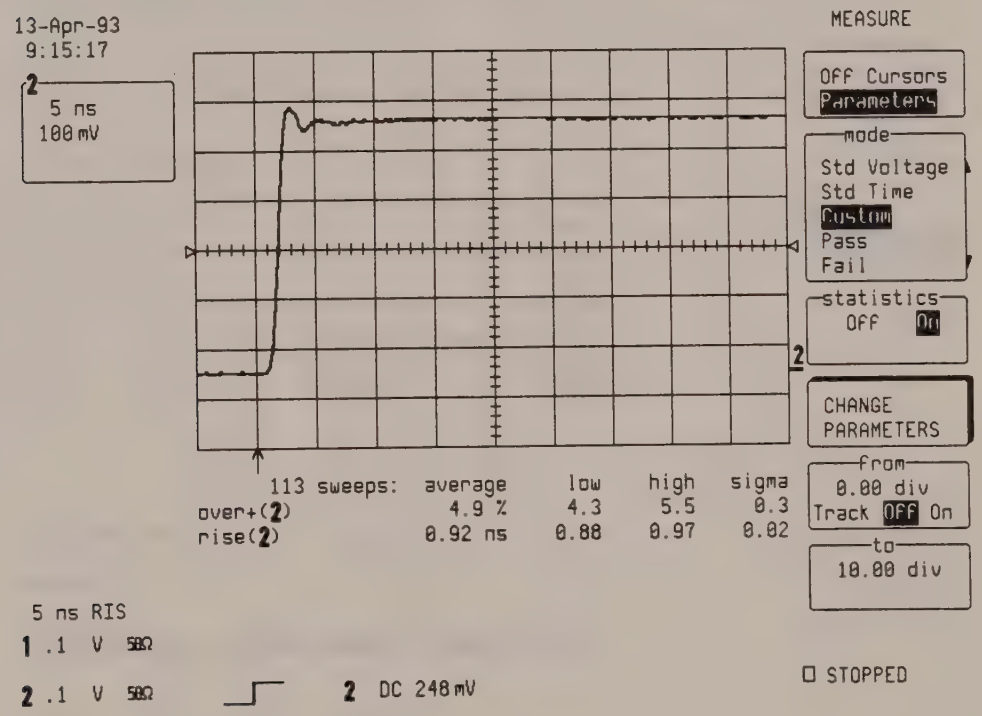
  Minimum Factor at 50 mV/div < 0.85



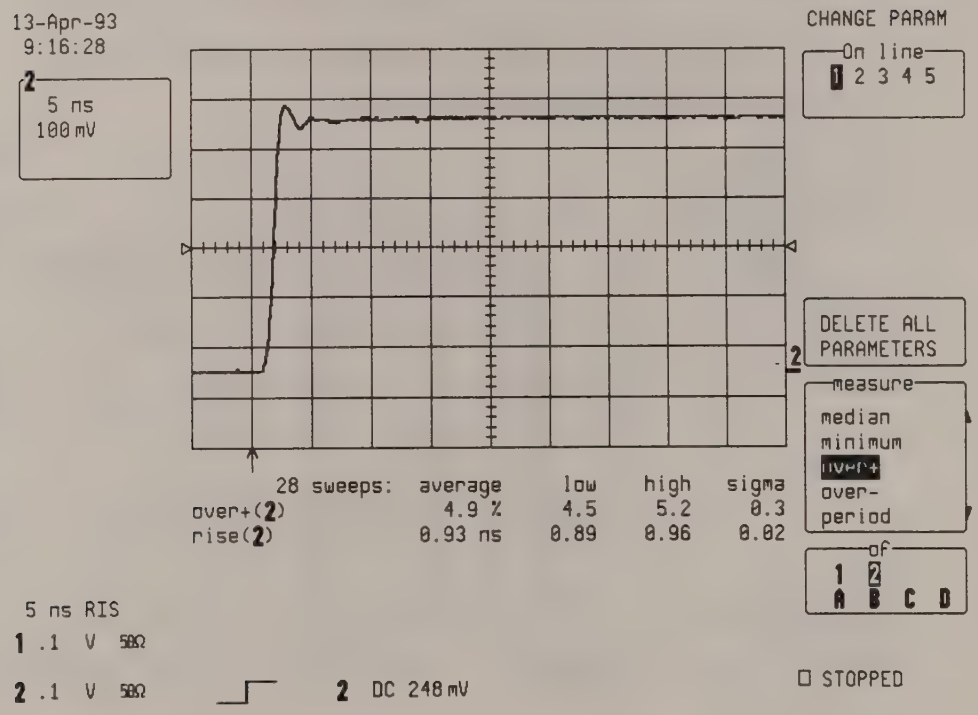
Ch2 DC Gain Adjustment with R4081

7.6.2.7.4 Channel 2 Overshoot Calibration

- Apply the pulse generator LeCroy 4969 to Ch2, set to 61.05 us period.
- Set DSO to 50 Ohm, DC, 100 mV/div, 5ns/div, RIS mode.
- Press Cursors/Measure push button.
- Select Parameters menu.
- Select Custom menu.
- Select Change Parameters menu.



- Select On Line 1, Measure Over+ of Ch2.
- Select On Line 2, Rise of Ch2
- Adjust C4026 in order to get 5% overshoot +/- 1 %.
- Rise time should be < 1.1 ns.



Ch2 Overshoot Compensation with C4026

7.6.2.10 Hysteresis Control

- Select the Calibration Diagnostics by simultaneously depressing the third and fourth push buttons, and then by depressing the fifth.

- Select Diagnostic Results.

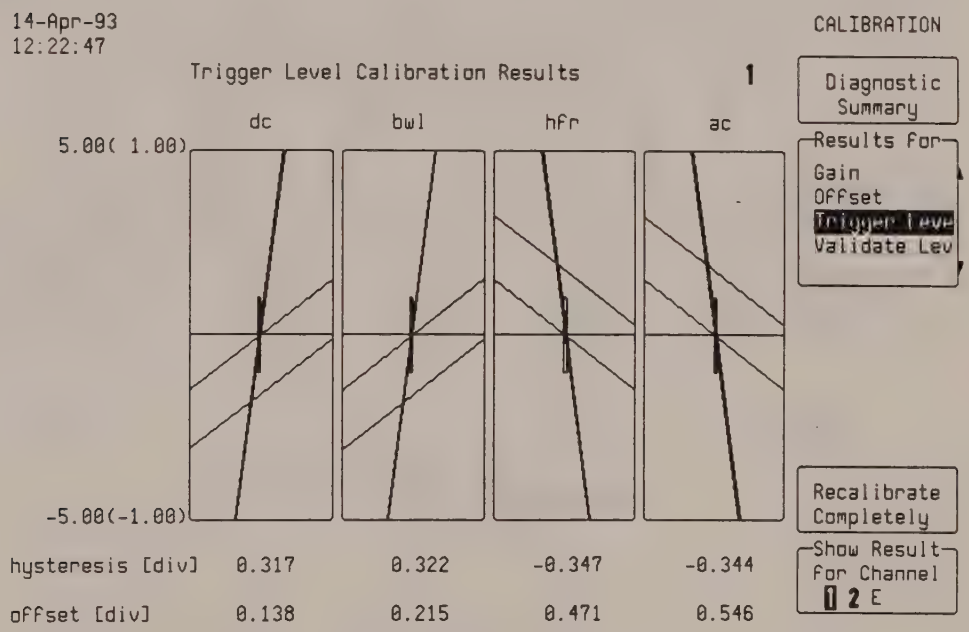
7.6.2.10.1 Trigger Level

- Select Trigger Level, and Show result for Channel 1.

- Adjust Potentiometer R5054 in order to get:

Hysteresis (div) = 0.35 div +/- 0.05 div (PCB Rev F and G)

or Hysteresis (div) = 0.50 div +/- 0.1 div (PCB Rev C and D)

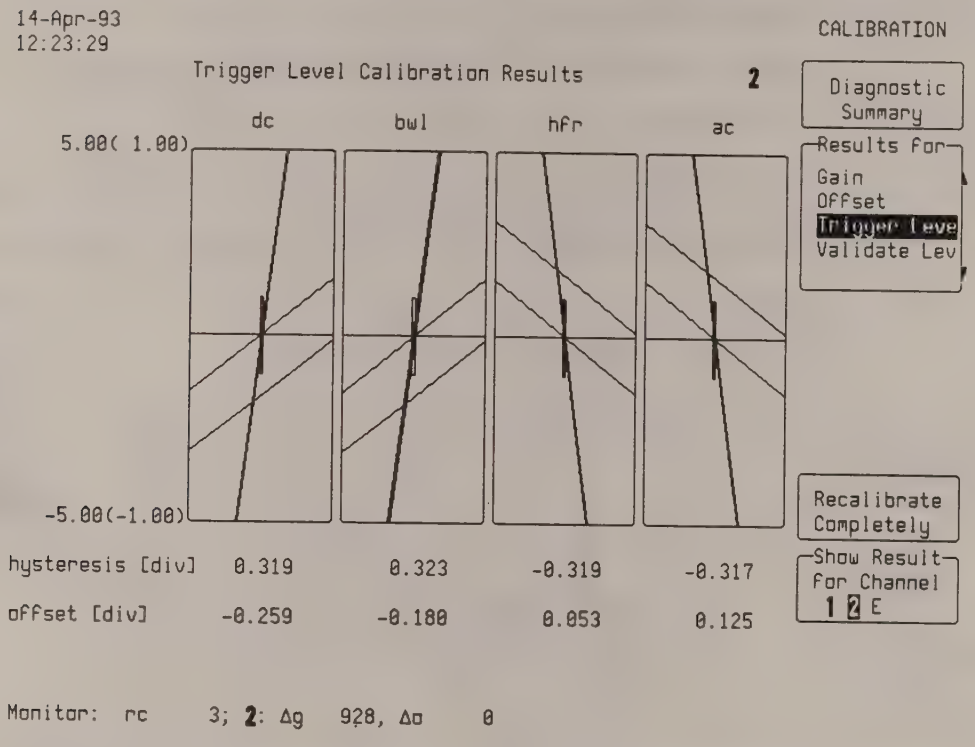


Ch1 Trigger Level

- Select Show Result for Channel 2

Hysteresis (div) = 0.35 div +/- 0.05 div (PCB Rev F and G)

or Hysteresis (div) = 0.50 div +/- 0.1 div (PCB Rev C and D)

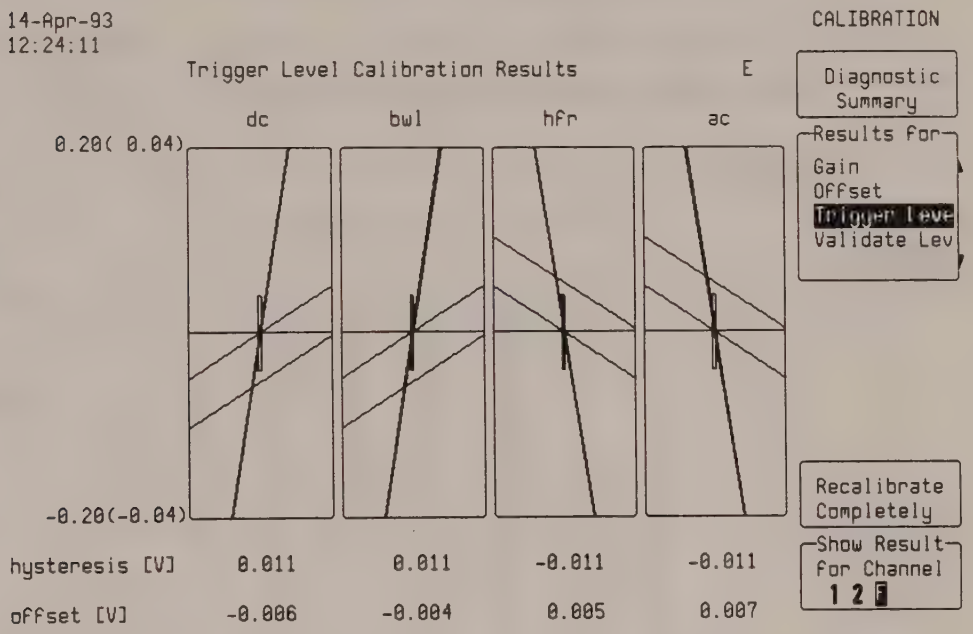


Ch2 Trigger Level

- Select Show Result for External Trigger

Check the Hysteresis (V) = 0.012 +/- 0.002 (PCB Rev F and G)

or Check the Hysteresis (V) = 0.02 V +/- 0.005 (PCB Rev C and D)



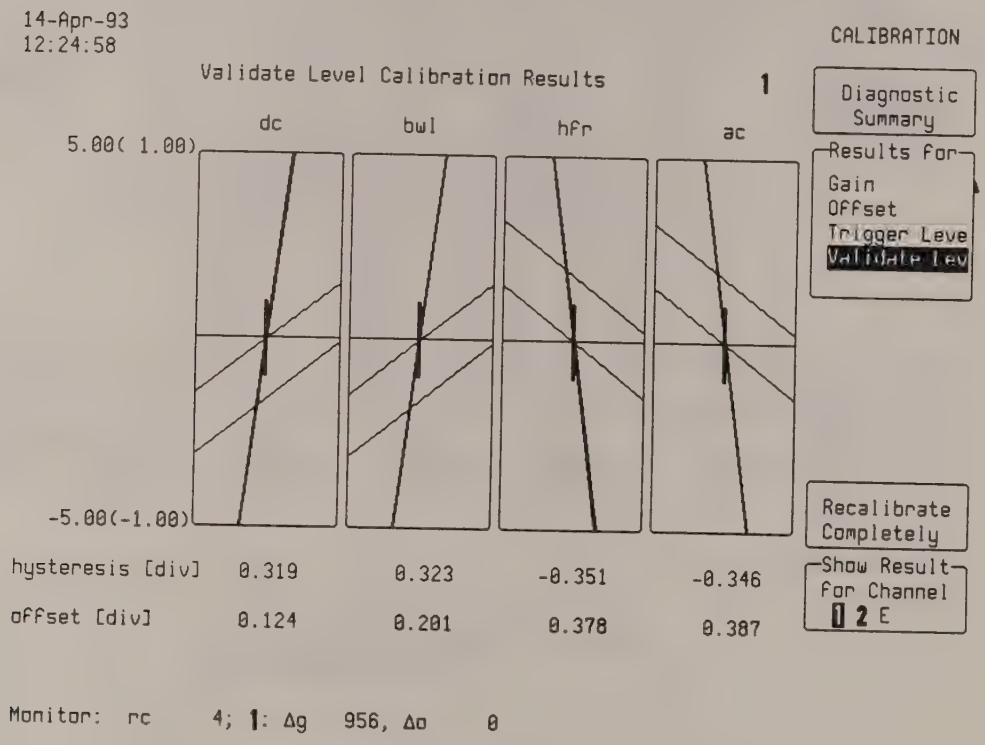
External Trigger Level

7.6.2.10.2 Validate Level

- Select Validate Level, and Show Result for Channel 1
- Adjust Potentiometer R5051 to get :

Hysteresis (div) = 0.35 div +/- 0.05 div (PCB Rev F and G)

or Hysteresis (div) = 0.50 div +/- 0.1 div (PCB Rev C and D)

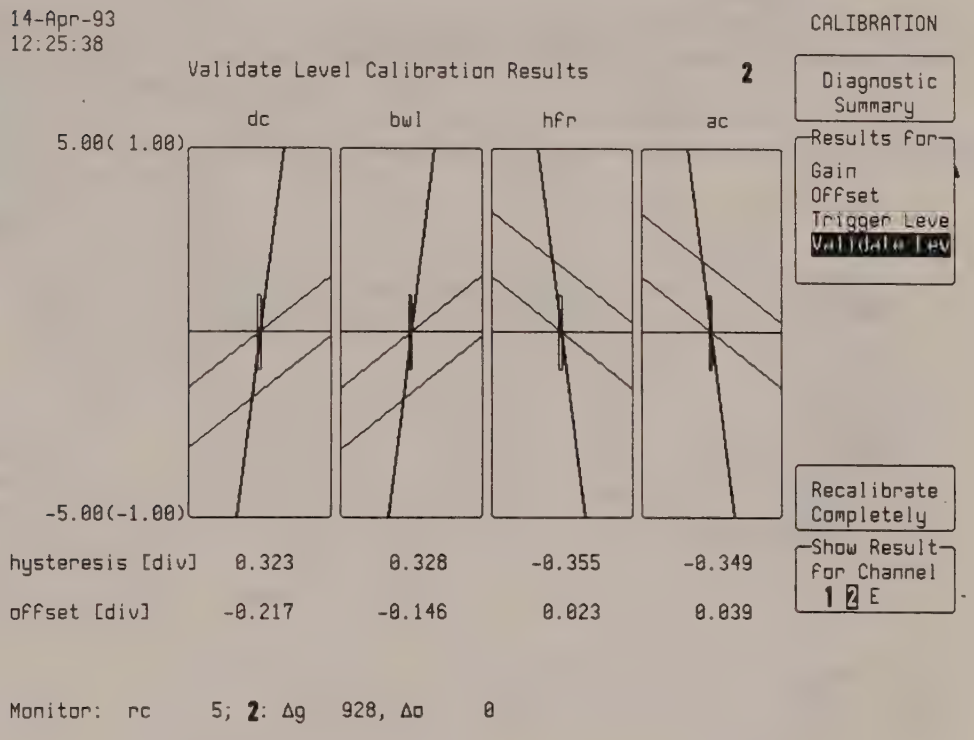


Ch1 Validate Trigger

- Select Show Result for Channel 2

  Check : 0.30 < Hysteresis < 0.40 for PCB Rev F and G

  Check : 0.4 < Hysteresis < 0.6 for PCB Rev C and D

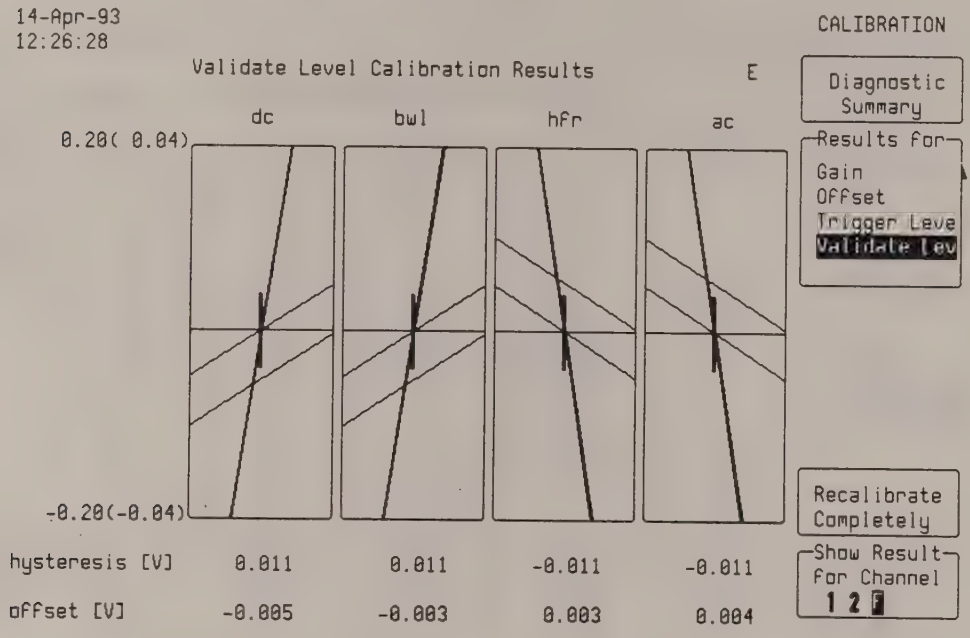


Ch2 Validate Level

- Select show result for External Trigger

Check : 0.010 < Hysteresis < 0.014 for PCB Rev F and G

or Check : 0.015 < Hysteresis < 0.025 for PCB Rec C and D



External Trigger Validate Level

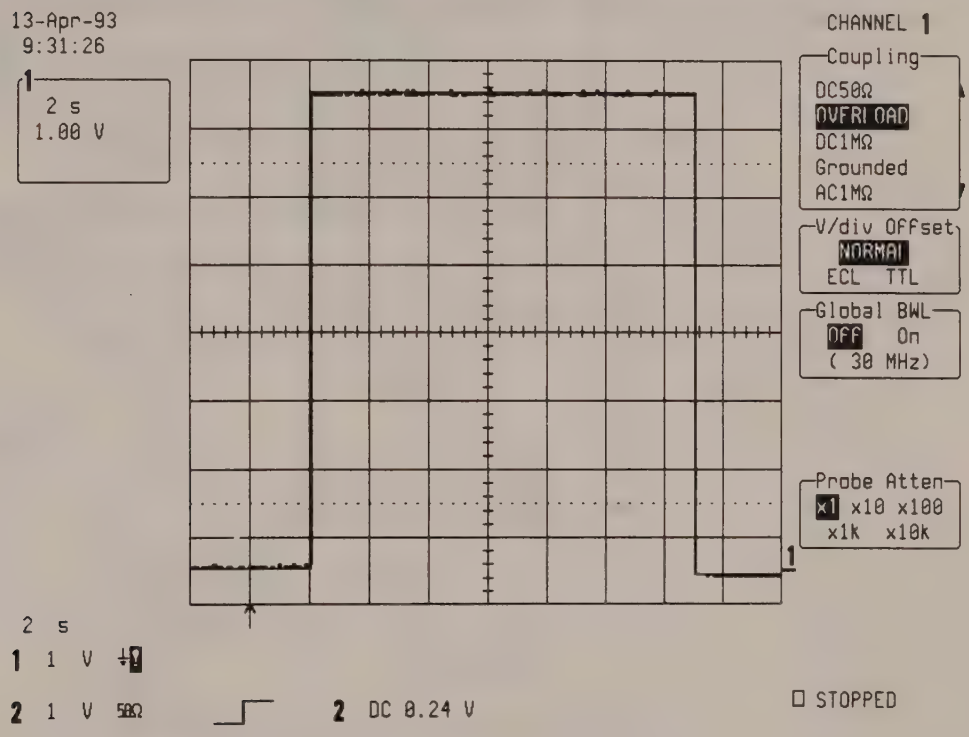
7.6.2.11 50 Ohm Overload Protection Adjustment

- Set Channel 1 and Channel 2 : 50 Ohm, 1V/div, 2s/div, Auto Trigger, Pos.

- Apply 7.07 V (1 Watt) to the channel to be tested.

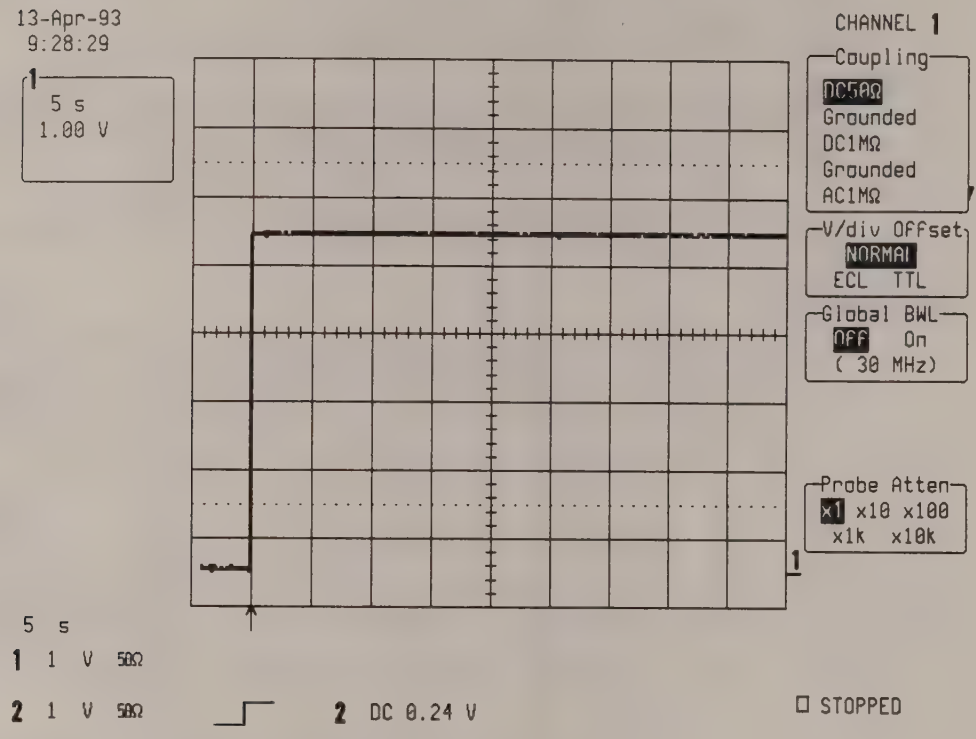
- Adjust the overload detection potentiometer R3013 for Channel 1, and R4013 for Channel 2 through the opening aluminium cover, such that the overload trips within 10 to 15 seconds.

- Turn the potentiometer clockwise if it's too slow or counterclockwise if it's too fast.



Ch1 Overload adjustment with R3013

- Apply 5 V (0.5 Watt) to the channel to be tested, and check that the overload doesn't trip after 40 seconds.



Ch1 Overload verification

7.6.3 93XX-Display Adjustment Procedure

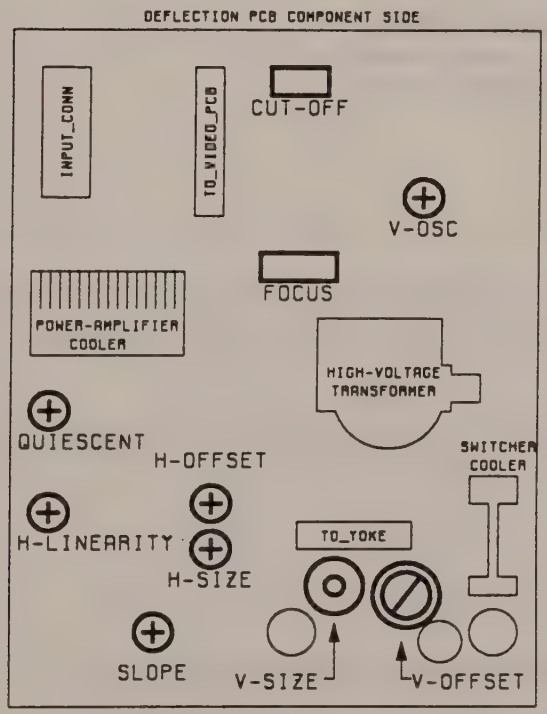
7.6.3.1 Introduction

There is a total of 12 potentiometers or variable coils to adjust the deflection and video board.

Deflection : (10 adjustments)

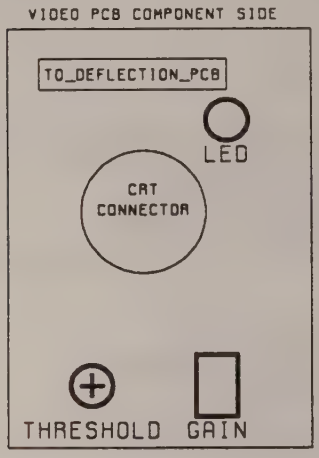
- Vosc : Frequency of the vertical oscillator.
- Slope : Speed of the horizontal ramp.
- Focus : Focus of the screen.
- Cut off : Cathode ray tube cut off.
- Quiescent: Standby current of the horizontal deflection amplifier.

- H Linearity: Horizontal linearity.
- H Size : Horizontal size (Max 165mm).
- H Offset : Horizontal position.
- V Size : Vertical size (Max 120mm).
- V Offset : Vertical position.



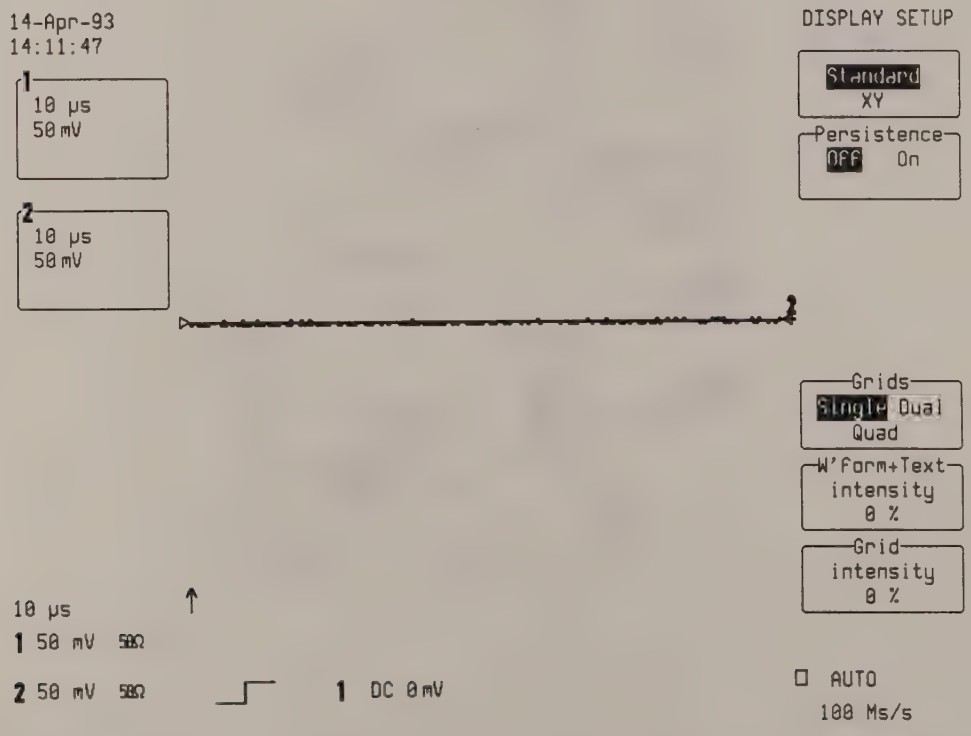
Video: (2 adjustments)

- Threshold: Level of the video board.
- Gain : Intensity of the screen.



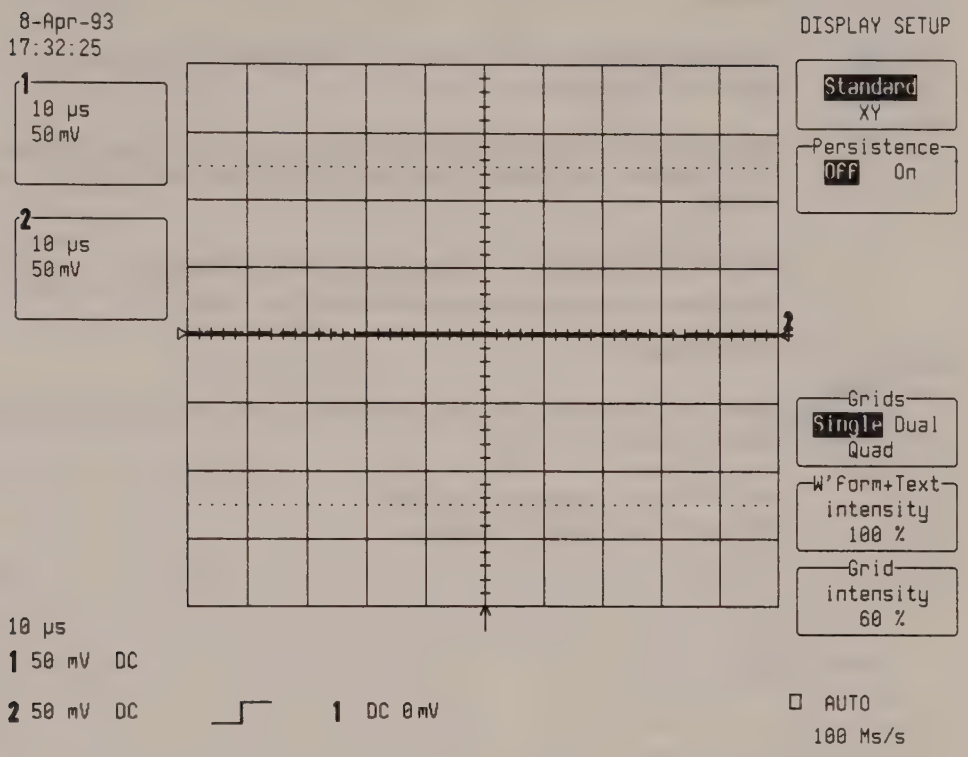
7.6.3.2 Coarse Adjustment

- Depress display button.
- Set W'form + text intensity to 0%.
- Set grid intensity to 0%.

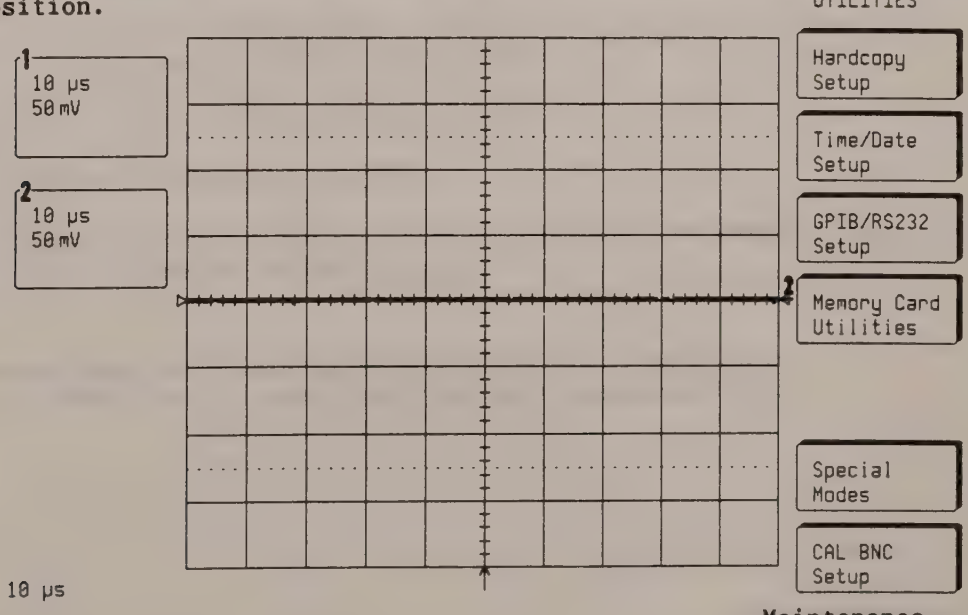


Adjust threshold potentiometer on the video board to see the red led just appear on.

- Set W'form intensity to 100%.
- Set grid intensity to 60%.



Adjust H-size, H-offset, V-size, V-offset to center the image in the screen.
The vertical position should be adjusted to get the push buttons of the front panel in front of the software menus, use the utilities set up.
The small magnets mounted on the deflection yoke influence the vertical position.



- Turn the quiescent potentiometer clockwise until the default of the horizontal lines just disappears from the vertical center of the screen.

- Increase the cut off until a vertical line appears on the right side of the screen.

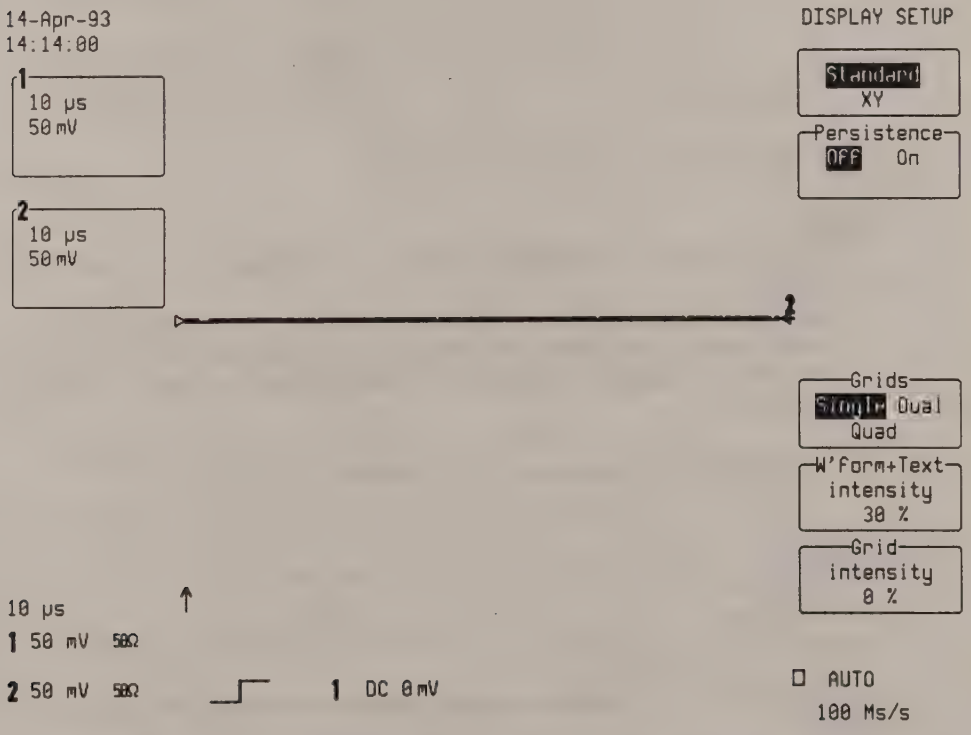
- Adjust the slope potentiometer to get 5mm gap between the highlighted vertical line and the right border of the selection menus.

- Adjust H-linearity to get the best linearity.

7.6.3.3 Fine Adjustment

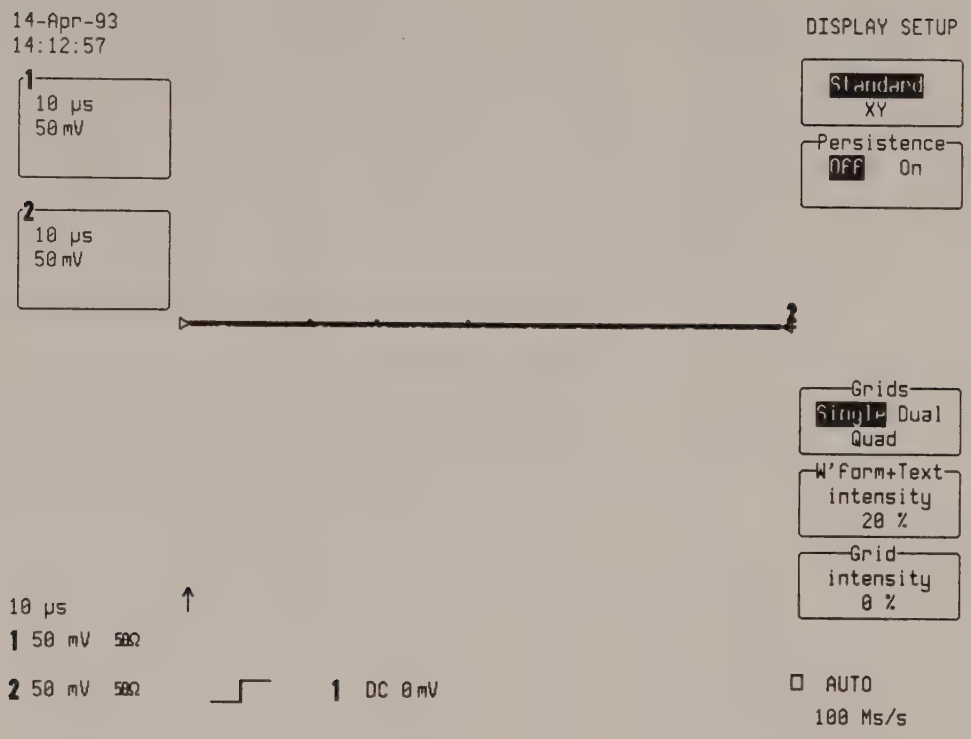
The final adjustment of the intensity cut off and focus must be made in a dark room.

- Set W'form intensity to 30%.
- Set grid intensity to 0%.



- Adjust the cut off potentiometer until the highlighted vertical line disappears from the right side of the screen.

- Set W'form intensity to 20%.



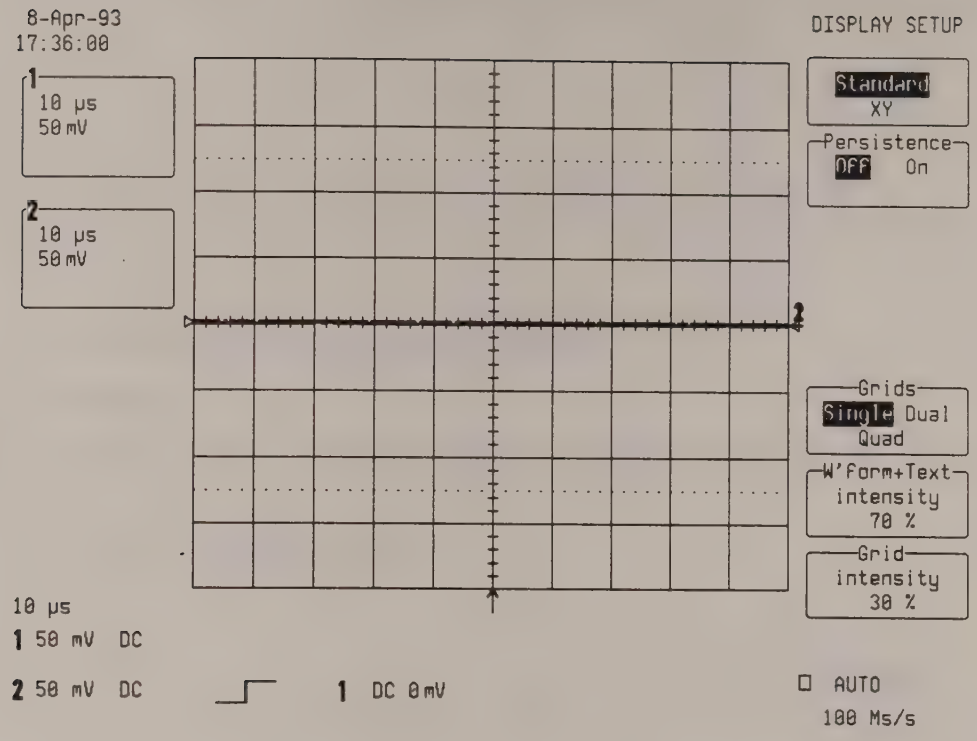
- Display channel 1 and 2 traces.

- On the video board adjust the gain potentiometer (intensity) in order to get the text just readable.

- Set W'form + text intensity to 70%.

- Set grid intensity to 30%.

- Adjust the focus (usually fully clockwise) for most uniform focus over the entire screen.



- In a standard luminosity environment set W'form + text to 90%, and grid intensity to 60%.
- verify the intensity, focus, and contrast adjustment, for best definition of the displayed text.

C A U T I O N

never change the Vosc calibration.

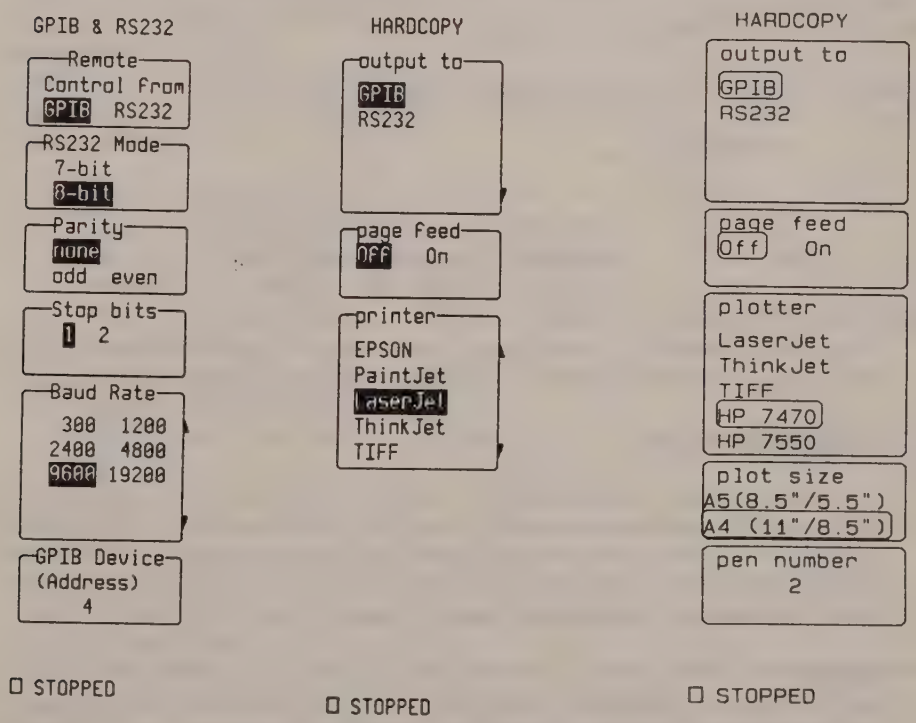
SECTION 10 CONNECTING the 9310 to a PLOTTER or a PRINTER

10.1 Introduction

LeCroy oscilloscopes are supplied with a list of plotters and printers known to work with them.
This list is not final, so any suggestions are welcome.

HP plotter responses to some RS-232 configuration commands have been evolved. Consequently, the 9310 generation DSO support HP plotters of two types, 7470A and 7550A. The only difference lies in the RS-232 initialization codes. They may however, despite these changes, work with HPGL compatible plotters from other manufacturers. If the HPGL data is used as input for a CAD or word processing system, it might be necessary to remove the data preceeding the in command. Before connecting a plotter to a 9310, do not forget to select the appropriate settings in the printer setup menu and the GPIB & RS-232 setup menu.



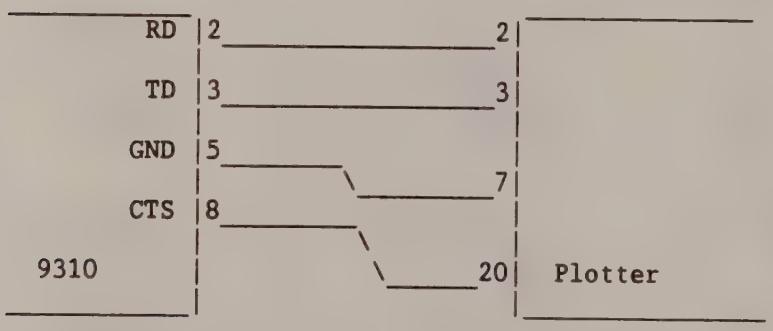
RS-232 connection

The following settings are assumed for the scope:
Baud rate: 9600
Character: 8 bits
Parity : none
Stop bits: 1
Any exceptions will be mentioned.

RS 232 interface

Pin 1: DCD
2: RD
3: TD
4: DTR
5: GND
6: DSR
7: RTS
8: CTS
9: RI

A cable with the following pinout can be used in almost every case:



The cable has D25 connector with male pins on the plotter side, and a D9 connector with female pins on the 9310 oscilloscope side.

GPIB Connection

To have a plot done through GPIB initiated with the front panel screen dump push button, you must set the 9310 in talk only mode by selecting remote control from RS-232, and the plotter in listen only mode.
If a computer controls the GPIB Bus, both the scope and the plotter must be set in addressed mode (remote control from GPIB).

Remark: the listen only mode does not work on some old HP plotters such as HP7585B or HP7475. The plotter must be set to listener before being able to receive any commands, which is a violation of the GPIB standard.

10.2 Plotters

10.2.1 HP 7470A Plotter

Switch settings:
- RS-232 Connection:
  S1 and S2: 0 0
  Y/D : D
  A4/US : User selectable
  B4 to B1 : 1 0 1 0

- GPIB listen only:
  A4/US : User selectable
  16 to 1 : 1 1 1 1 1

- GPIB Addressed:
  A4/US : User selectable
  16 to 1 : 0 0 1 1 1

10.2.2 HP 7550A Plotter

Responses to some ESC characters commands are not the same in this plotter as in older HP models like the 7470A. In fact, ESC sequences of commands which give excellent results in the 7470A can prevent any handshake in RS-232.
Problems of this kind have been reported in the case of ESC.R and ESC.@ commands. When combined with ESC.I and ESC.N, ESC.@ breaks up all handshakes.

RS-232 configuration:
- Enter into display 5 (HP-IB MONITOR...).
- Select STANDARD OF STANDARD/ENHANCED.
- Enter into SERIAL sub-menu (display 6)
- For DATA_FLOW, select REMOTE. Either STANDALONE or EAVESDROP may be chosen.
- Enter into display 7 (DUPLEX, PARITY, BAUD).
- Select FULL duplex.
- Configuration PARITY and BAUD rate to the same values as on the DSO.

A standard cable may be used, provided it has a female connector on the plotter side.
Do not start a plot while a sheet of paper is being loaded!

- GPIB configuration:
  If the scope is in TALK ONLY, the plotter must be in LISTEN ONLY. Selection will be done at display 5.
- Note : Its seems that the plotter must be powered off, then on again, to take any configuration change into account.

10.2.3 Hitachi 672 Graph Plotter (or NSA 672)

As this plotter is compatible with the 7470A, select this mode on the plotter menu page.

Switch settings

- RS-232 Connection:
  Sw. A, 1 and 2: 1 1 (ISO A3) or (ISO A4).
  Sw. A, 3 to 8 : 1 0 1 1 0 1
  Sw. B : 1 1 1 1
- Note:
  When switches are set to ISO A4, the pen must be manually repositioned at the top of the page (or plotter reset by powering it off and on) before loading a new sheet of paper.

10.3 Printers

Interfacing is possible through RS-232, GPIB directly, and in option through Centronics. The parallel interface F9300-6 (Centronics) is an option, see section 4.5.

10.3.1 Centronics Printers

Most printers use a Centronics parallel connection which makes direct connection possible if the 9310 is equipped with the optional Centronics interface F9300-6 board.
If the printer has a Centronics connector then it's a parallel printer, and the F9300-6 board is required or a serial to parallel converter.

If a serial to parallel converter is used, in the printer setup menu select device type Epson, and remote control from RS-232.
RS-232 Remote control port settings:

Baud rate:	9600 or 19200
Characters length (bits):	8
Parity:	none
Number of stop bits:	1

The following printers and printer switch positions have been tested via serial to parallel adapter.

	Switch 1	Switch 2
1. Epson LQ-1000	1, 2, 3, 4 ON	2, 6, 7 ON
2. Diconix 150P	1 ON	2, 6, 7 ON
3. HP-ThinkJet 2225C	2, 4, 5 ON	
4. HP-DeskJet 550 C	all down	6 up for 19200 bauds

Note: all Epson and Epson Compatible printers are likely to work if the switches are set properly. (Some experimentation may be required).

Some available serial to parallel converters need power through the RS-232 lines. Do not use them, as we do not guarantee that the serial port is able to furnish enough power.

10.3.2 RS-232 Printers

10.3.2.1 Epson FX80

It is possible to use the standard RS-232 cable. Such a printer has the optional RS-232 interface "#8143" installed. The configuration that follows is valid for the default scope setting. The standard cable is usable.
In the particular case of an FX850:

- the main switches SW1 SW2 remain at the factory configuration

SW1	1	2	3	4	5	6	7	8
	OFF	OFF	ON	OFF	OFF	ON	ON	ON

SW2	1	2	3	4
	ON	OFF	OFF	OFF

- the 8143 switches are set to:

1	2	3	4	5	6	7	8
ON	OFF	OFF	OFF	n/a	OFF	OFF	ON

- the 8143 jumpers remain at the factory settings:

J1	J2	J3	J4	J5	JC	JNOR	JRVE	JF	JX
OFF	OFF	OFF	OFF	ON	OFF	ON	OFF	ON	OFF

Note: Epson printers only support XON/XOFF support handshake if they have a print buffer. Such printer are:
FX, FX+, JX-80, LQ-800/1000, EX-800 and LQ-25000.
Otherwise, use DTR/RTS handshake.

10.3.2.2 Citizen 120D

To use this printer with the default RS-232 setting and default printer setting of the 9310, select the following switch configuration:
DIP switch bank 1: all off except 3 and 8, DIP switch bank 2: all off.

10.3.2.3 HP LaserJet

Make sure that page feed is ON in the plotter menu to use the LaserJet. It is advisable to start out in single density with a size of A5. Then, depending upon the internal buffer size on the LaserJet, the image size and/or density can be increased. At one point, the internal buffer size of the DSO is also reached. The image is simply truncated, indicating that either density or size have to be reduced.

10.3.2.4 HP QuietJet

10.3.2.5 HP ThinkJet

To use printer with the default RS-232 setting and with the default cable select the following switch configuration:

- mode switch:

1	2	3	4	5	6	7	8
0	0	0	0: 11" page length 1: 12" page length	0	0	0	0

- RS-232 switch:

1	2	3	4	5
1	0	0	0	0
(use DTR handshake)	(8bits, parity none)		(9600 bauds)	

Note: it may be possible that old ThinkJet recognize only the Epson protocol. If it is the case use the Epson.

10.3.2.6 HP DeskJet 550C

The standard cable is usable. The printer has been tested at 19200 bauds with the following configuration :

Switch 1 or Bank A : all down
Switch 2 or Bank B : 6 up for 19200 bauds, all the other down

10.3.2.7 Brother Printers

The Brother M-1509 and M-1709 have been tested with a serial connection. On the oscilloscope select "Epson FX-80 or compatible printer".

The switch settings are identical for both the printers:

- SW1:

1	2	3	4	5	6	7	8
OM	ON	ON	OFF	ON	n/a	n/a	ON

- SW1:

1	2	3	4	5	6	7	8
<----------ALL OFF---------->							

- SW1:

1	2	3	4	5	6	7	8
OFF	OFF	OFF	OFF	11": OFF 12": ON	OFF	ON	OFF

10.3.3 GPIB Printers

10.3.3.1 HP QuietJet

Make sure the dip switches on the backplane of the printer are set to

- SRQ enable: 0

- GPIB listen only:
  Listen always: 1
  A5 to A1: 0 0 1 1 1

- GPIB Addressed:
  Listen always: 0
  A5 to A1: 0 0 1 1 1

10.3.3.2 HP ThinkJet (HP 2225A)

Make sure the dip switches on the backplane of the printer are set to

- SRQ Enable: 0

- GPIB listen only:
  Listen always: 1
  A5 to A1: 0 0 1 1 1

- GPIB Addressed:
  Listen always: 0
  A5 to A1: 0 0 1 1 1

10.3.3.3 HP PaintJet (black/white only)

Make sure the dip switches near the GPIB connector are set to:

- GPIB Listen only:
  NORM/SCS : NORM
  A3 to A1 : 1 1 1
  PC8/ROM8 : N/A
  ENG/MET : has to match paper size ENG = 11" MET = 12"

- GPIB addressed:
  NORM/SCS : NORM
  A3 to A1 : any combination except 1 1 1
  (correspond to add. 0-6)
  PC8/ROM8 : N/A
  ENG/MET : has to match paper size ENG = 11" MET = 12"

10.4 Information on GPIB

10.4.1 Introduction

This section is a simple description of the GPIB interface as an aid to understanding the interface in the 9310 DSO: it is not intended as a complete specification of the system.

The GPIB system is designed for the interaction of a number of devices, which may transmit or receive information as required. The system includes data lines over which the actual data are sent, bus management lines for control, and handshake lines to ensure correct acceptance of data at the right destination. The main features of the bus are summarized below:

Maximum number of devices	15
Maximum bus length	20 meters or 2 meters per device, whichever is less
Connection	star or chain

Note that more than half of any connected devices must be powered up, even if they will not be used.

Data lines		8 DIO 1 to 8
Handshake lines	DAV	Data available
	NRFD	Not ready for data
	NDAC	not data accepted
Bus management lines	EOI	End or identity
	IFC	Interface clear
	SRQ	Service request
	ATN	Attention
	REN	Remote enable

Active level	+0,4 V
Inactive level	+3,3 V

Note that all signal lines are active low, and that they are wire ORed to allow participation by all devices.
In addition, there are 8 ground lines, making a total of 24 lines.

10.4.2 Functions in the GPIB

In order to allow satisfactory interconnection of several devices the following functions must be provided

- Enabling any device to transmit data
- Preventing any device from transmitting data
- Enabling any device to receive data
- Preventing any device to receive data
- Transmitting data to a specific device
- Ensuring that only one device is transmitting
- Ensuring that transmitting takes place only when reception is possible
- Enabling any device to request servicing
- Identify type of data to be sent

Any device can be activated into the "talk" or "listen" state, and can be deactivated by the commands "untalk" and "unlisten". Also a device can be a "controller".

Maximum number of current talkers	1
Maximum number of current listeners	14
maximum number of current controllers	1

Function of bus lines:

- DAV Data available; talker says the data on the line are valid.

- NRFD Not ready for data; listener says it is not ready for more data. All listeners must release the NRFD line, i.e., let it go high, before talker can send.

- NDAC Not data accepted; listener says it has not yet accepted the data. Talker must hold all data lines steady until all listeners have released this line, i.e., it goes high.

Clearly, the NRFD and NDAC are easy to implement by a wired OR system, so that any one device asserting the signal prevents progress to the next step. Progress is made at the speed of the slowest listener. A simple timing diagram is given in figure 10.1, and another way of presenting the system is given in figure 10.2.

The bus management lines functions as follows:

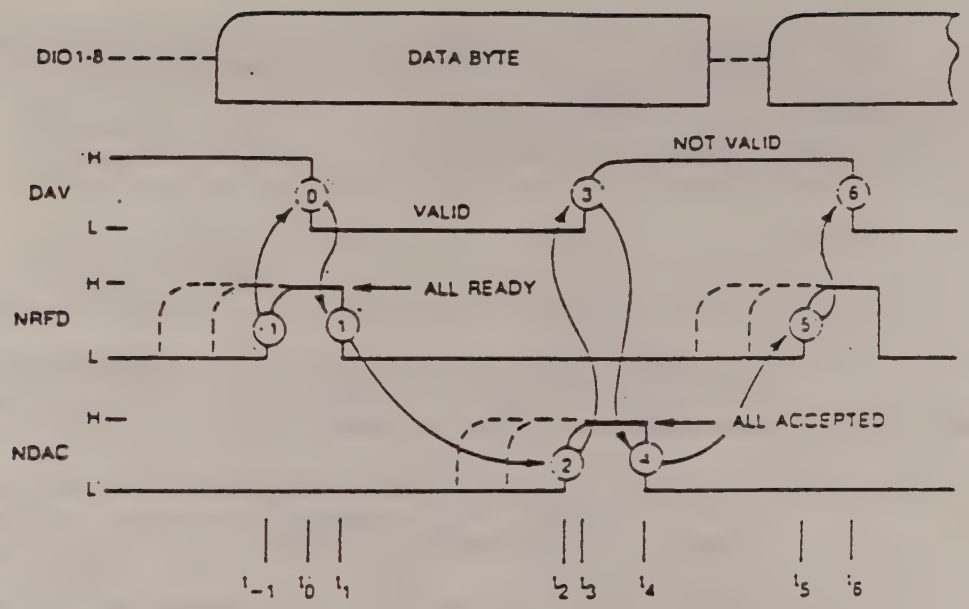
- EOI End Or Identify; talker sends this with last byte of a block transfer to indicate last byte. Also used with ATN to parallel poll devices for their status bit.

- IFC InterFace Clear; places the GPIB system into a quiescent state.
- SRQ Service ReQuest; any device can send it to the controller to indicate need for attention, and to request interruption of current operations.

- ATN ATeNtion; controller sends this to specify whether DIO lines are to be used for interface messages, e.g., addressing, or for data.

- REN Remote ENable; selects a device as being under local or remote control.

Addressing of the devices on the GPIB bus consult a specialized GPIB-IEEE488 document.
The principles of GPIB are quite simple - the system must wait for all users, and lines are wire ORed so that all can pull the lines down.
The handshake sequence is illustrated in two ways. In figure 10.1 the signal waveforms are sketched, while figure 10.2 is a flowchart.

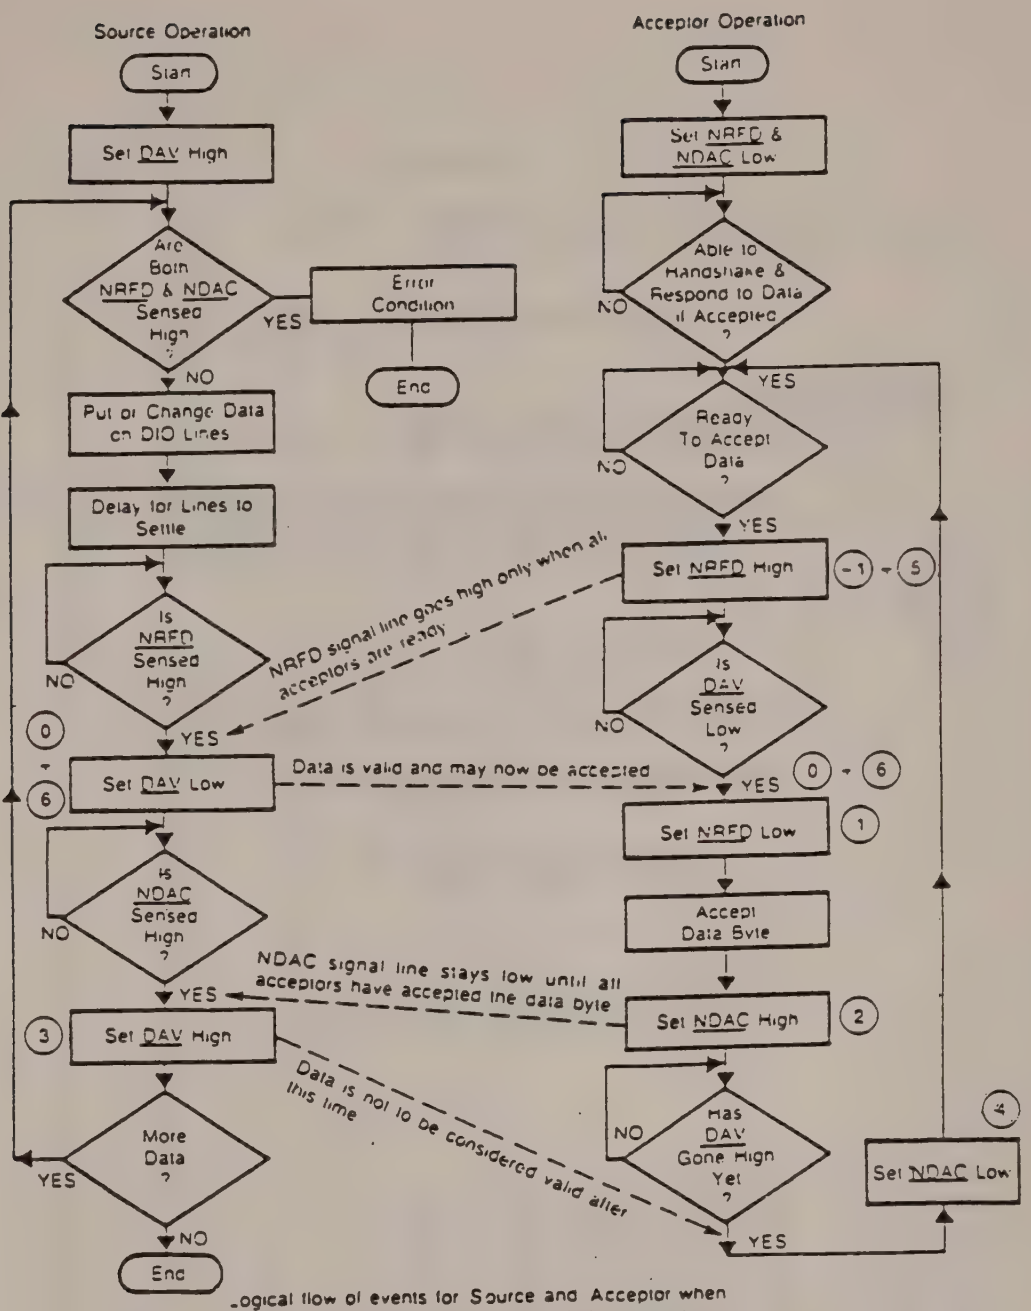


DATA BYTE TRANSFER IN GPIB IEEE-488

Figure 10.1

The handshake timing sequence proceeds as follows:

Preliminary	The source checks for presence of listeners and places the next data byte on the data lines DI01-8.
t-1	Acceptors one by one become ready for byte. Last one allows NRFD to go high.
t0	Sources pulls down DAV to validate data.
t1	The first litener to accept the data pulls down NRFD to show it is no longer ready for a new byte.
t2	The listeners one by one accept the data, and the last one lets NDAC go high.
t3	The source sets DAV high to show this byte is no longer valid.
t4	The listeners one by one accept this, the first one pulling NDAC low for the next cycle.
t5	As for t-1.



Logical flow of events for Source and Acceptor when transferring data using the handshake process

HANDSHAKE TIMING SEQUENCE IN GPIBIEEE-488
